

Q: How many perfect matchings in this graph?

---

# CSE 331: Algorithms & Complexity “Gale-Shapley III”

Prof. Charlie Anne Carlson (She/Her)

**Lecture 6**

Wednesday September 9th, 2025

**University at Buffalo®**

# Schedule

---

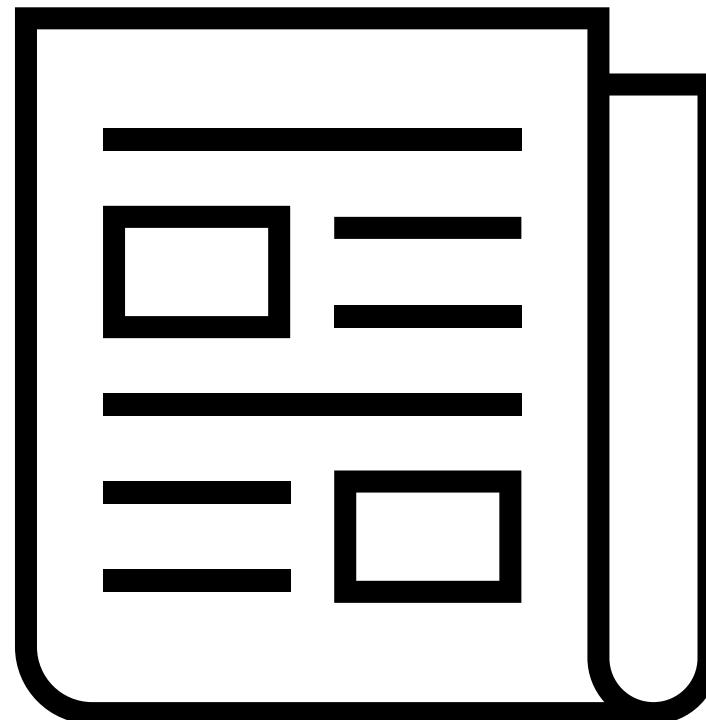

1. Course Updates
2. Recap
3. Even More Gale-Shapely

# Course Updates

---

- Complete Syllabus Quiz
- HW 1 Posted
  - Autolab Tomorrow
- HW 0 Being Graded
- Website Moved
- Project Signup before 19th

# Gale-Shapley Algorithm

---

**GALE-SHAPLEY** (*preference lists for hospitals and students*)

---

**INITIALIZE**  $M$  to empty matching.

**WHILE** (some hospital  $h$  is unmatched and hasn't proposed to every student)

$s \leftarrow$  first student on  $h$ 's list to whom  $h$  has not yet proposed.

**IF** ( $s$  is unmatched)

        Add  $h-s$  to matching  $M$ .

**ELSE IF** ( $s$  prefers  $h$  to current partner  $h'$ )

        Replace  $h'-s$  with  $h-s$  in matching  $M$ .

**ELSE**

$s$  rejects  $h$ .

---

**RETURN** stable matching  $M$ .

# Claim Time!

---

**Claim:** The algorithm always outputs a stable matching.

**WHILE** (some hospital  $h$  is unmatched and hasn't proposed to every student)

$s \leftarrow$  first student on  $h$ 's list to whom  $h$  has not yet proposed.

**IF** ( $s$  is unmatched)

Add  $h-s$  to matching  $M$ .

**ELSE IF** ( $s$  prefers  $h$  to current partner  $h'$ )

Replace  $h'-s$  with  $h-s$  in matching  $M$ .

**ELSE**

$s$  rejects  $h$ .

# Proof Idea Time!

---

**Claim:** The algorithm always outputs a stable matching.

**Proof (Ideas):**

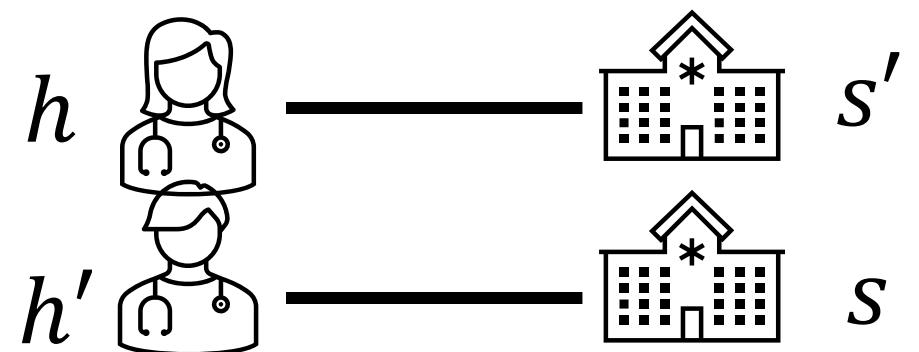

1. Show that every unmatched pair is not unstable.
2. **Show that the existence of an unstable pair would be a contradiction.**

# Proof Time!

---

**Proof:** We proceed with a proof by contradiction.

- Suppose to the contrary that the matching  $M$  returned was unstable. Then there must exist an unstable pair  $(h, s)$ .
  - Since we know that matching returned is perfect, we know there exists hospital  $h'$  and student  $s'$  such that  $(h, s') \in M$  and  $(h', s) \in M$ .

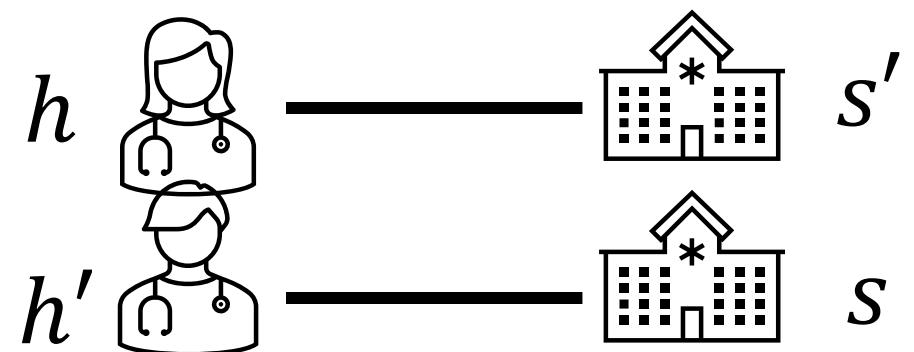

# Proof Time!

---

**Proof:** ...

- Suppose  $h$  did propose to  $s$  at some point in the algorithm.
  - Then  $s$  must have at some point rejected  $h$  and thus, must prefer  $h'$  to  $h$ . (Not Unstable)

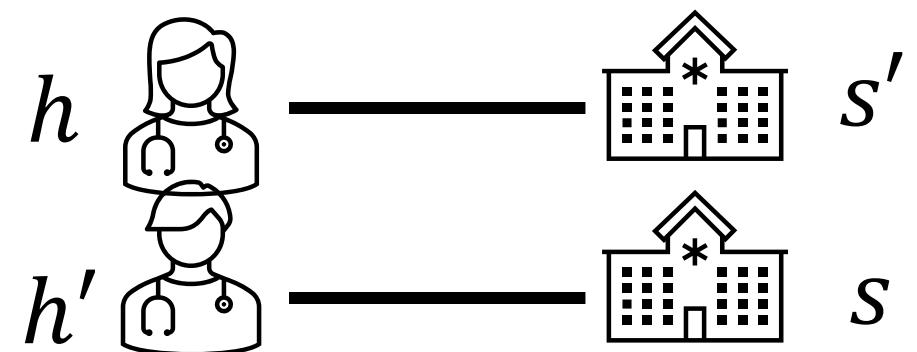

# Proof Time!

---

**Proof:** ...

- Suppose  $h$  did not propose to  $s$  at some point in the algorithm.
  - Then  $h$  must have proposed to  $s'$  first and thus, must prefer  $s'$  to  $s$ . (Not Unstable)

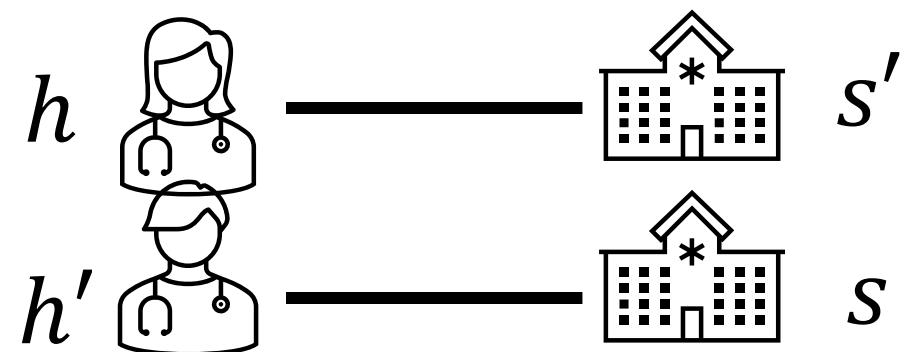

# Proof Time!

---

**Proof:** ...

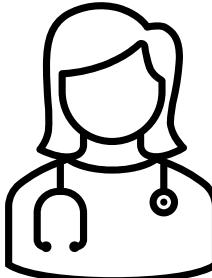

- In all cases we have concluded that if there is an unstable pair then the pair is can't be unstable. This is a contradiction and thus there can be no unstable pairs.

# Q: Is there just one Stable Matching?

---

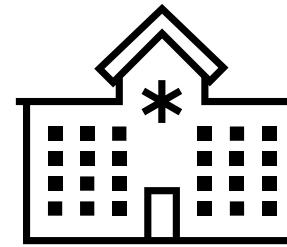

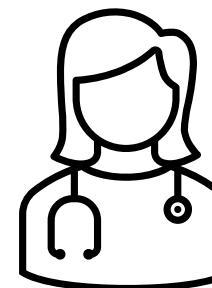

Dr. One  
 $A > B > C$

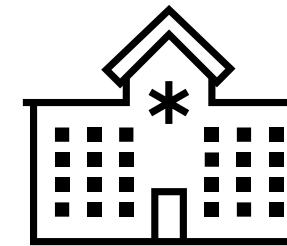

Dr. Two  
 $B > A > C$

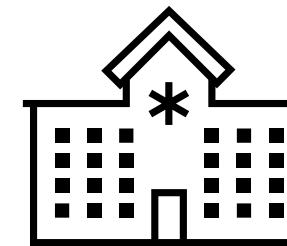

Dr. Three  
 $A > B > C$

Hospital A  
 $2 > 1 > 3$

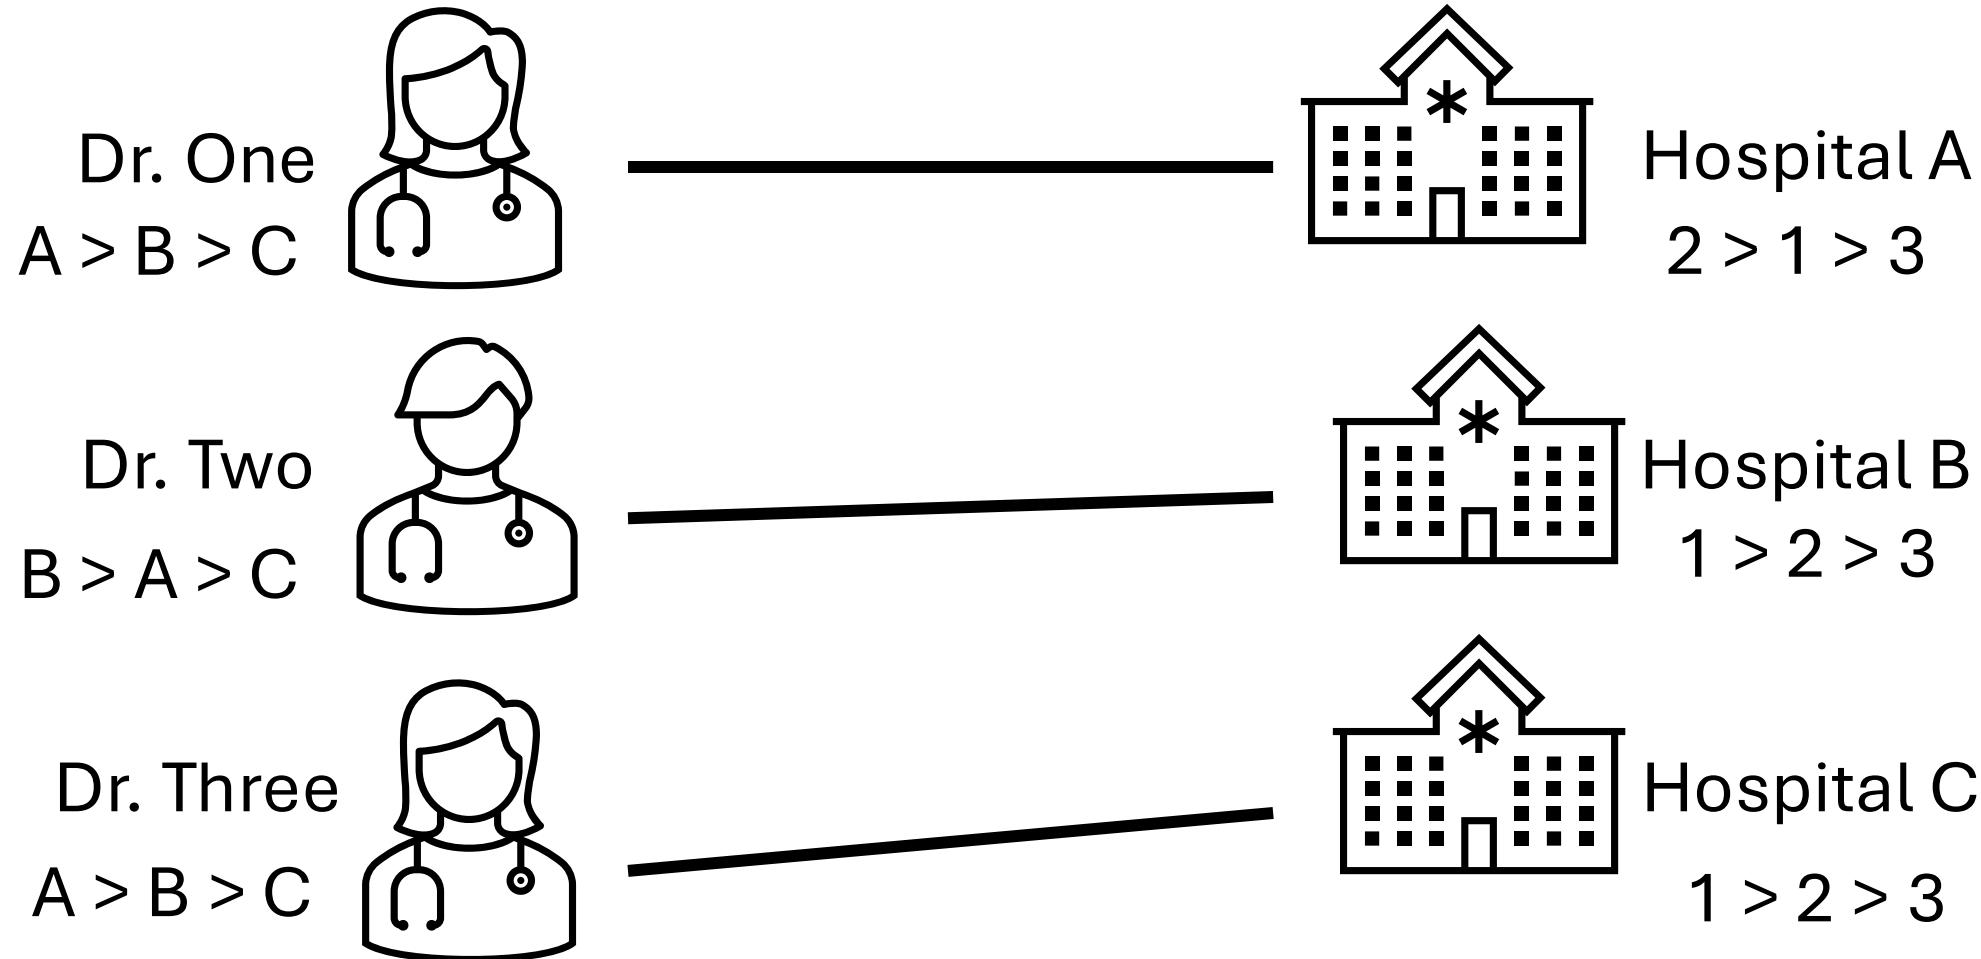

Hospital B  
 $1 > 2 > 3$

Hospital C  
 $1 > 2 > 3$

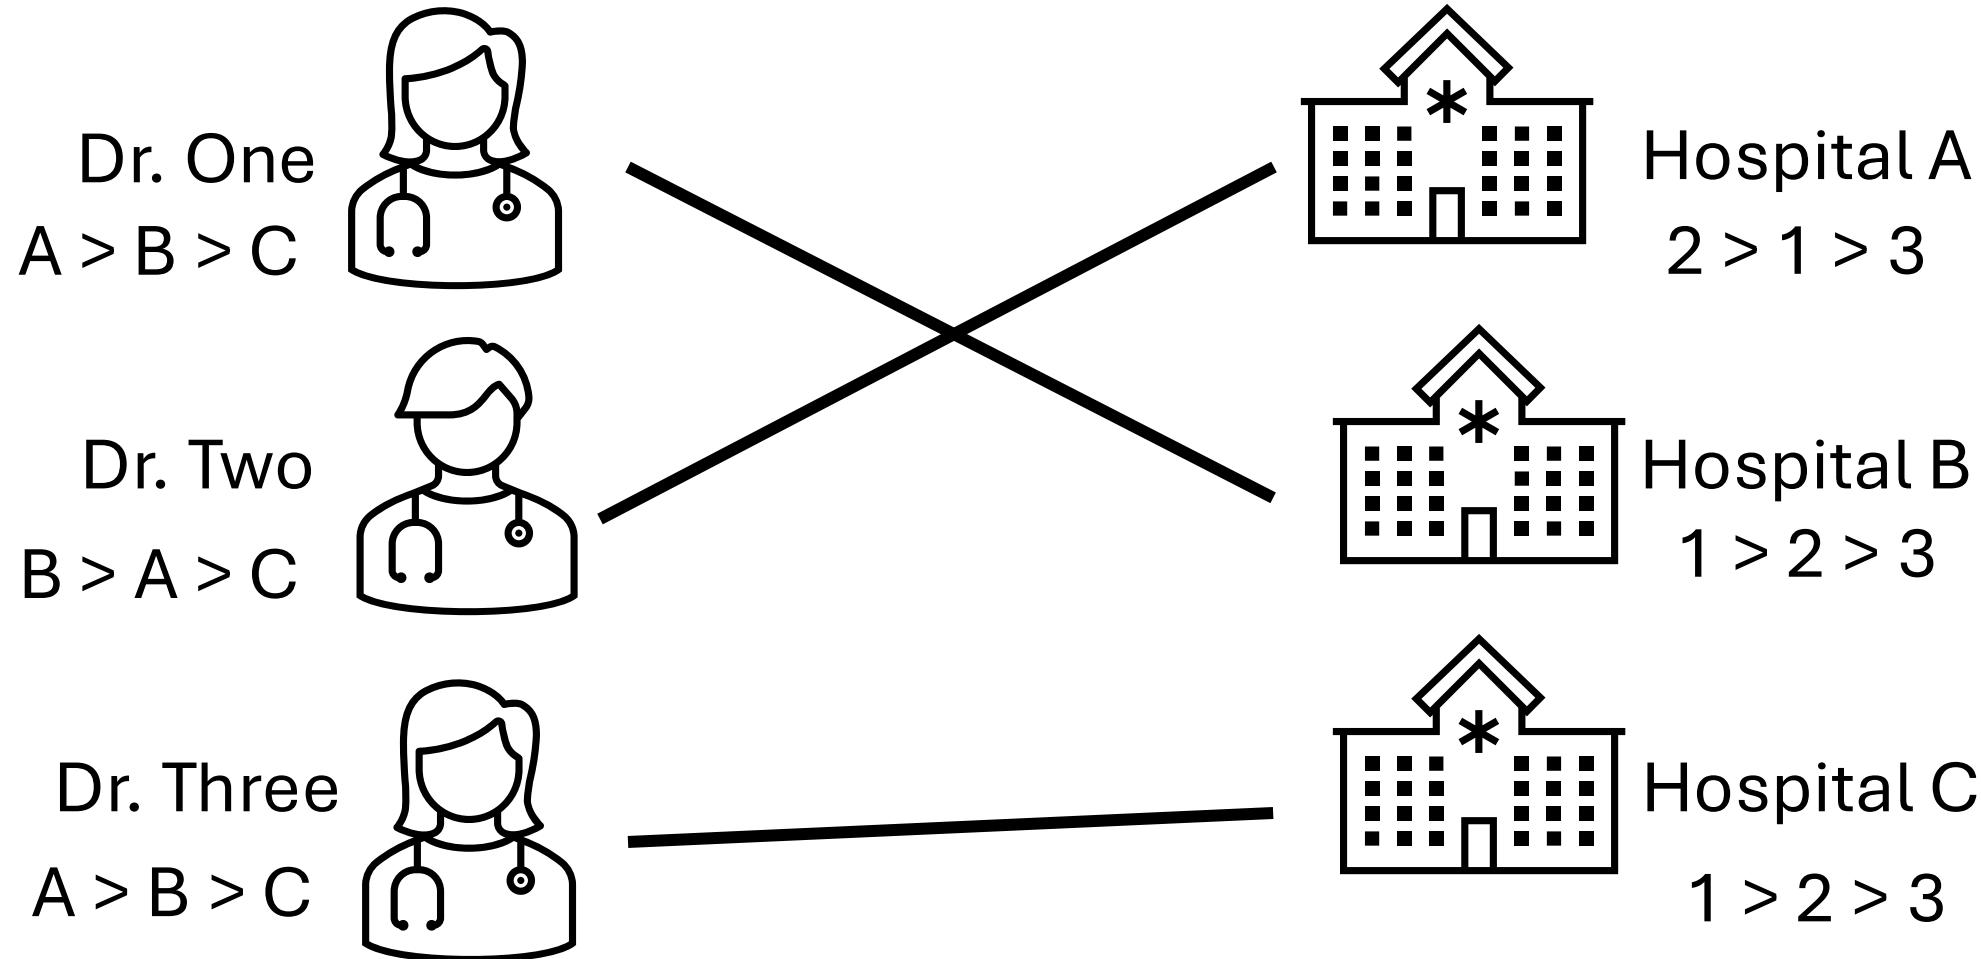

# Matching I

---

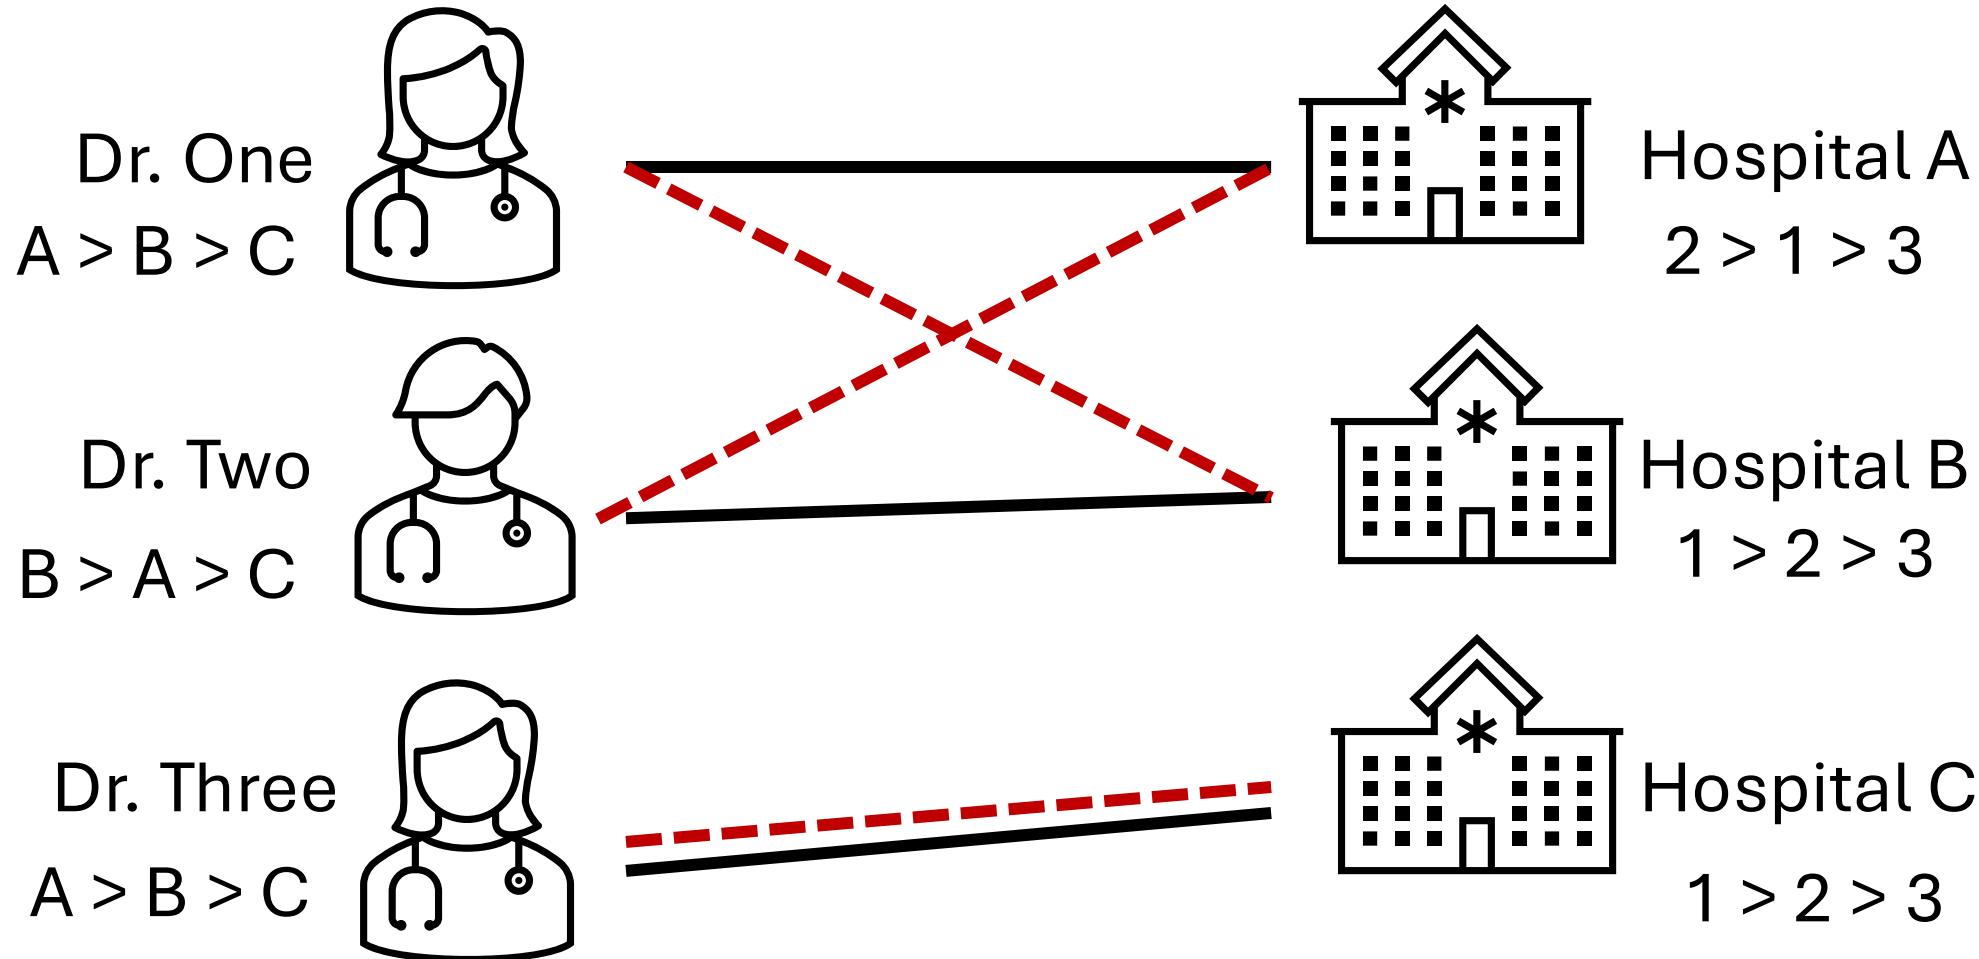

# Matching II

---

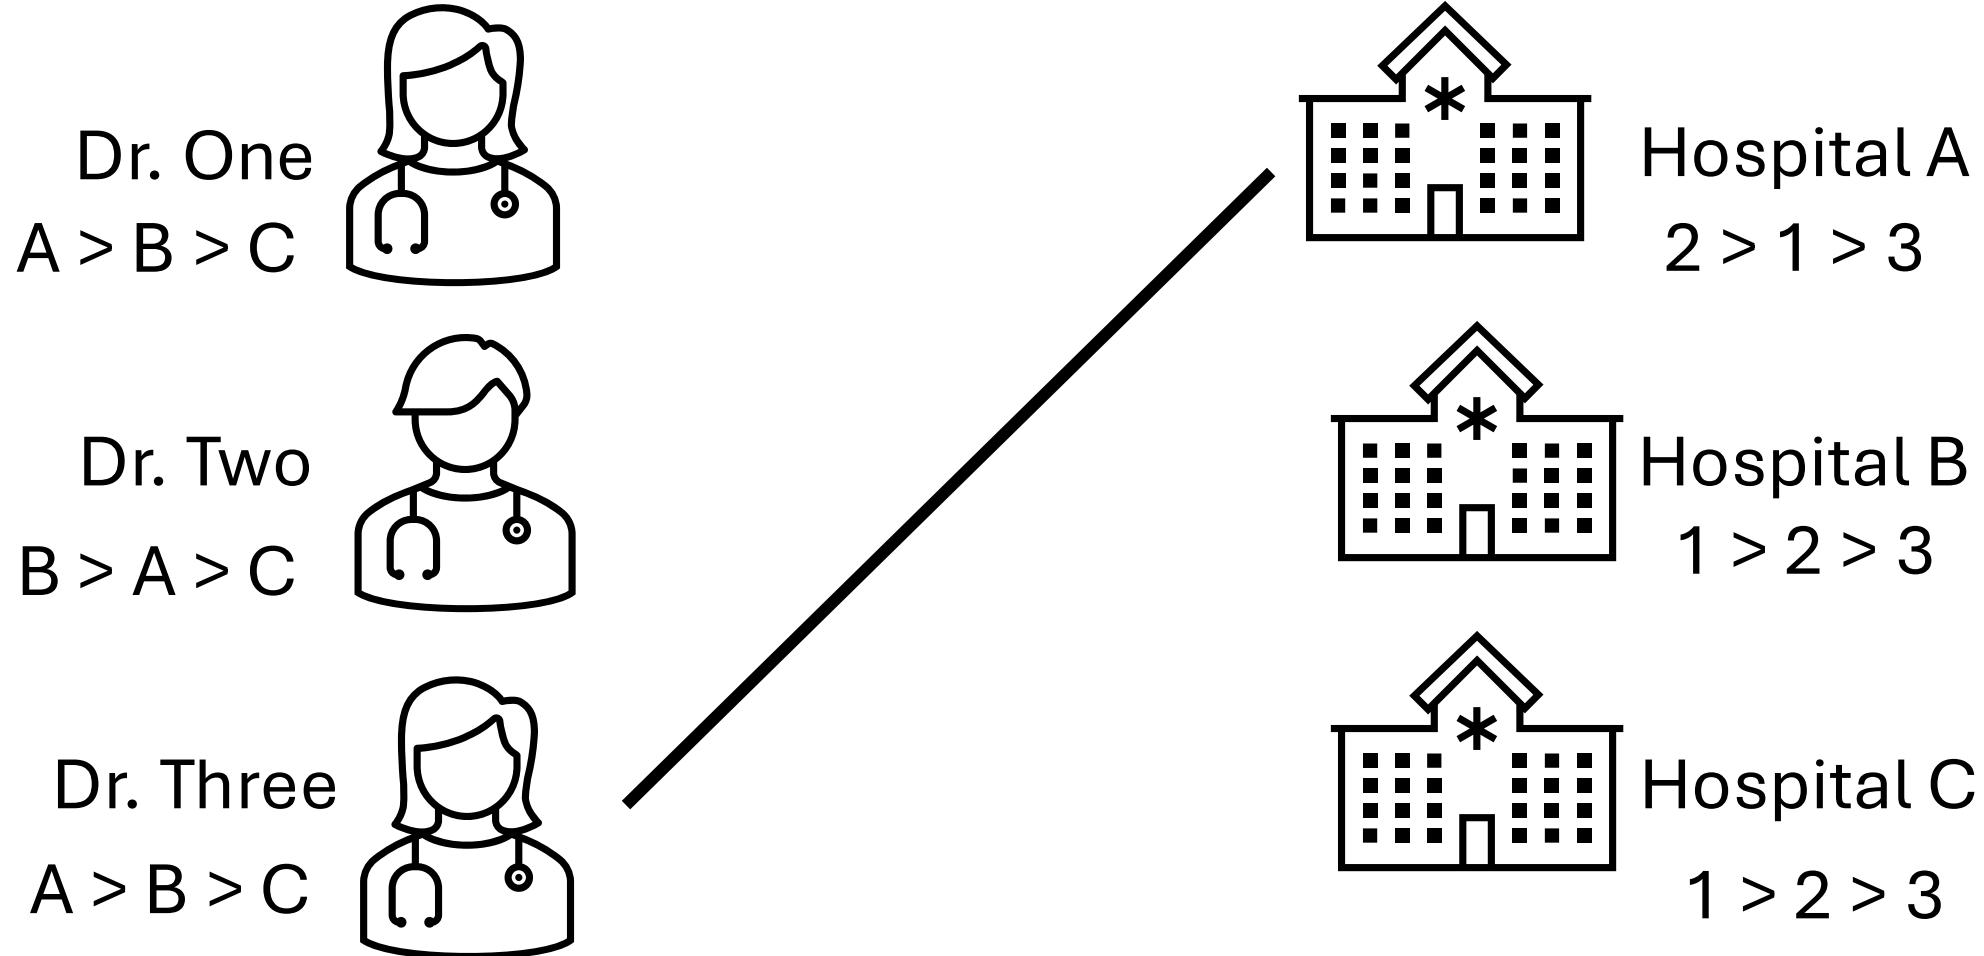

# Matching I vs Matching II

---

# Q: Is there a Stable Matching with this edge?

---

# Valid Partners

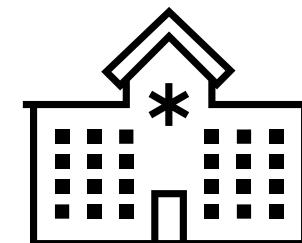

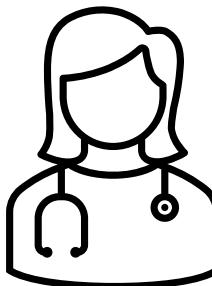

---

**Def:** We say student  $s$  is a *valid partner* of hospital  $h$  if there exists a stable matching in which  $s$  and  $h$  are matched.

**Q:** What would be a student's *best valid partner*?

E.g.:

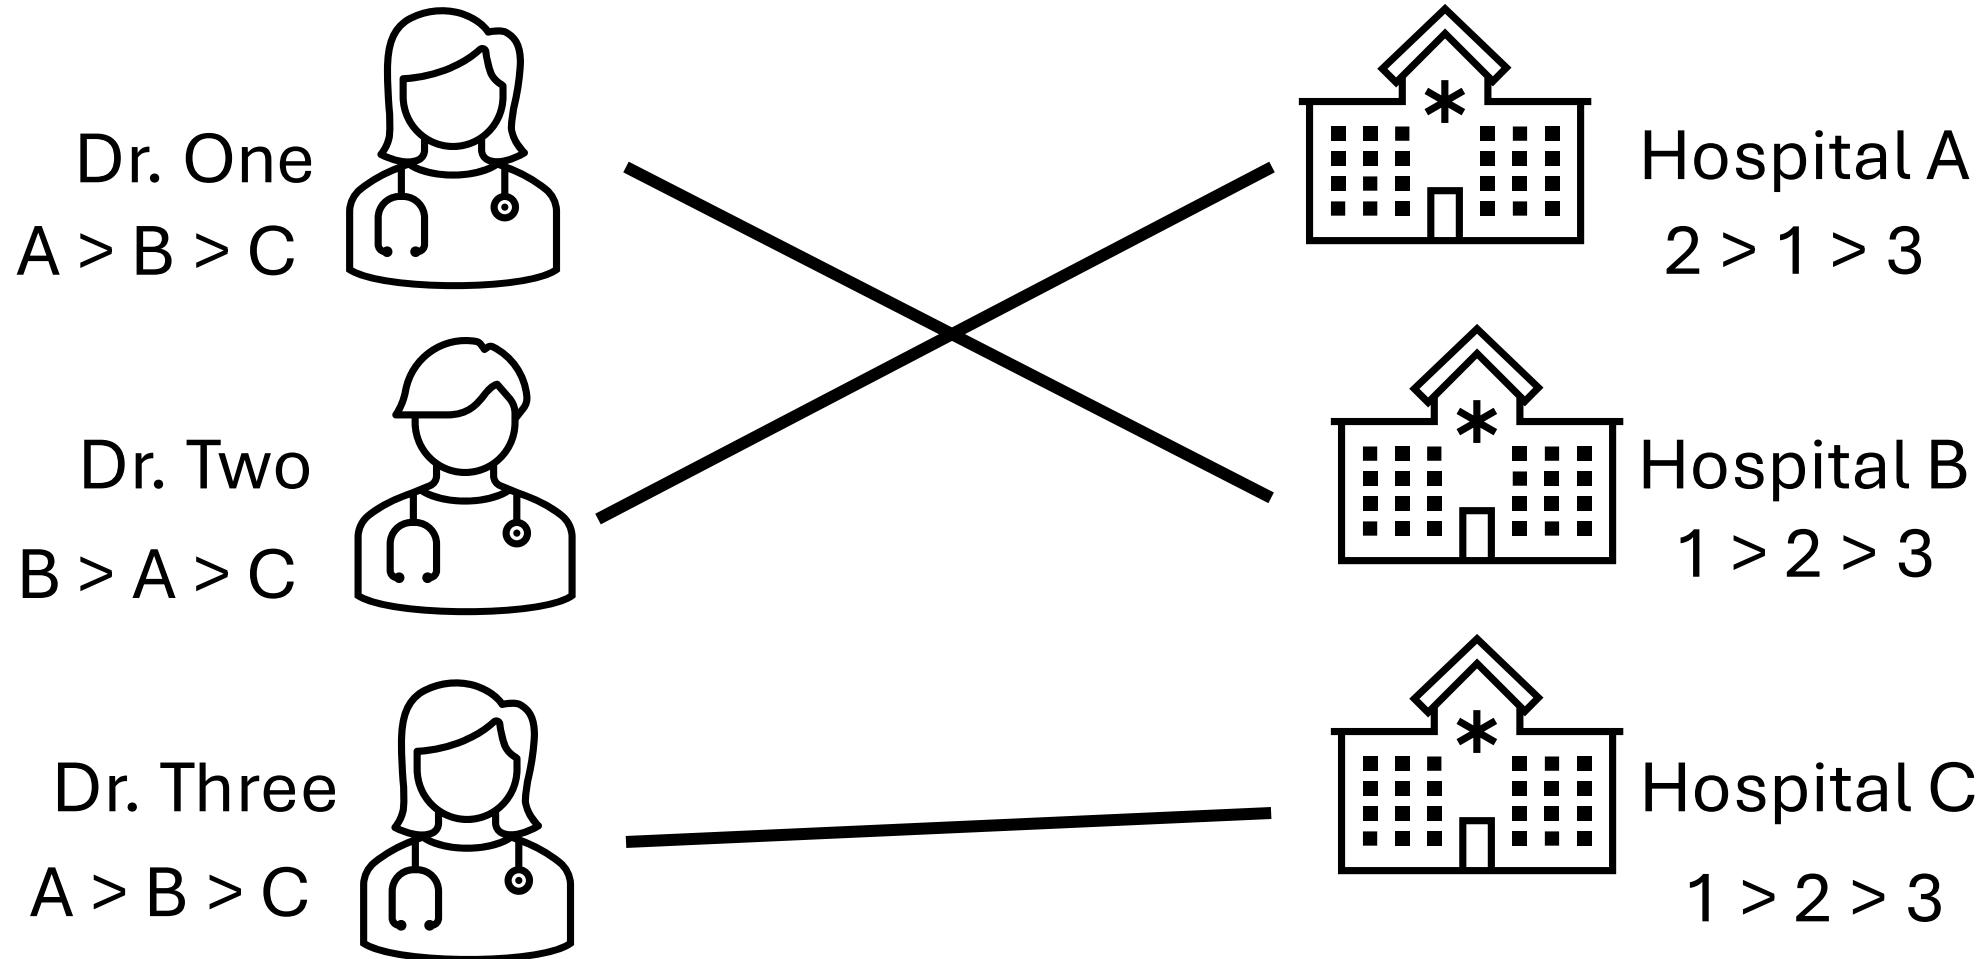

Dr. Three  
 $A > B > C$

Hospital C  
 $1 > 2 > 3$

# Q: Who is Dr. Two's best valid partner?

---

# Valid Partners

---

**Def:** The *student optimal assignment* is the one in which all students are matched with their best valid partner. The *hospital optimal assignment* is the one in which all hospitals are matched with their best valid partner.

**Q:** Are these optimal assignments stable matchings?

**Q:** Can we find them?

# Claim Time!

---

**Claim:** The algorithm always outputs the hospital-optimal assignment.

**WHILE** (some hospital  $h$  is unmatched and hasn't proposed to every student)

$s \leftarrow$  first student on  $h$ 's list to whom  $h$  has not yet proposed.

**IF** ( $s$  is unmatched)

Add  $h-s$  to matching  $M$ .

**ELSE IF** ( $s$  prefers  $h$  to current partner  $h'$ )

Replace  $h'-s$  with  $h-s$  in matching  $M$ .

**ELSE**

$s$  rejects  $h$ .

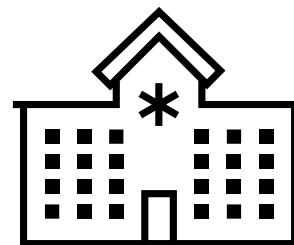

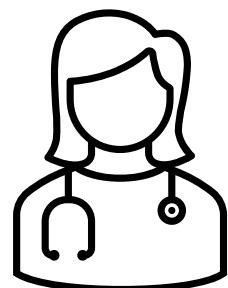

# Proof Idea Time!

---

**Claim:** The algorithm always outputs a stable matching.

**Proof:**

- Suppose to the contrary that the output is not hospital optimal. We will show that....

# Proof Idea Time!

---

## Proof:

- Suppose to the contrary that the output  $M$  is not hospital optimal.
- Then let  $h$  be the **first hospital** to be rejected by a valid partner  $s$ .
- Let  $M'$  be the stable matching with  $s$  and  $h$  paired together.

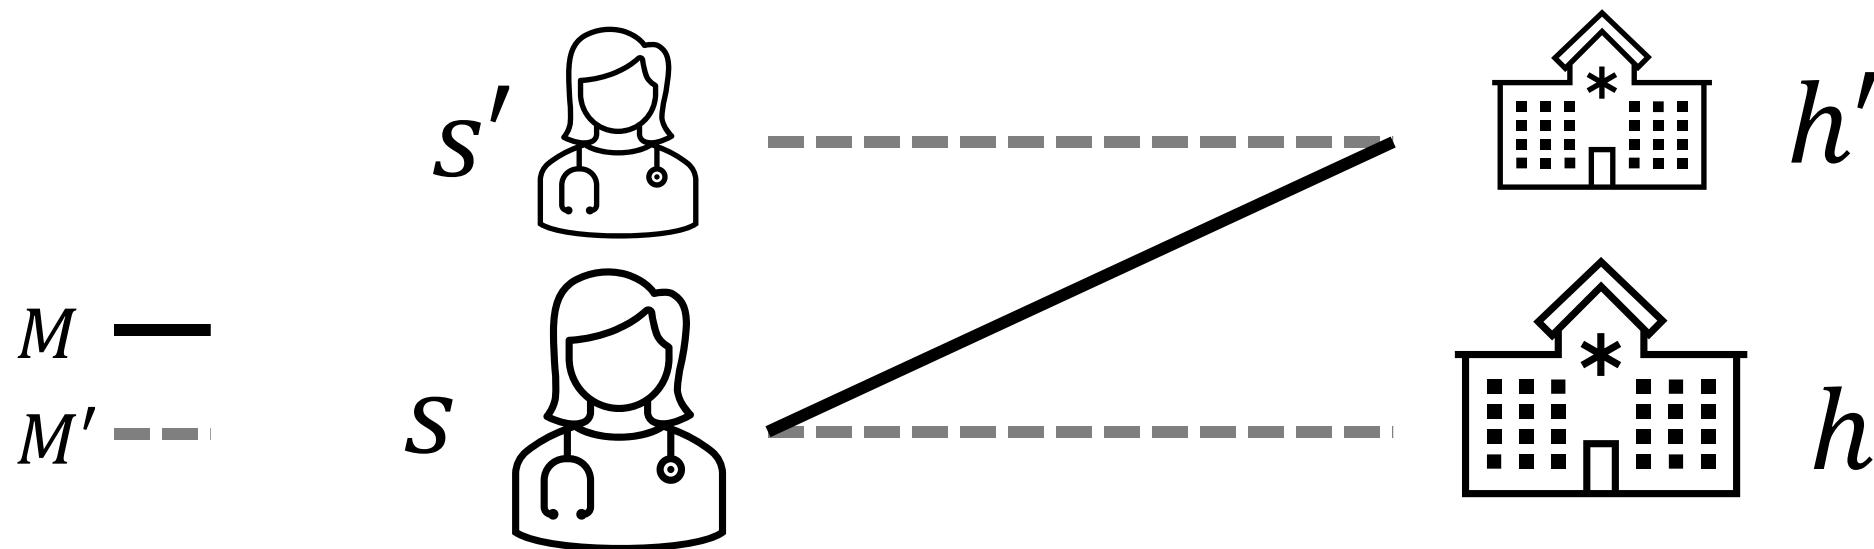

# Proof Idea Time!

---

**Proof:** ...

- Let  $h'$  be the hospital paired with  $s$  in the output of the algorithm. Let  $s'$  be the student paired with  $h'$  in  $M$ .

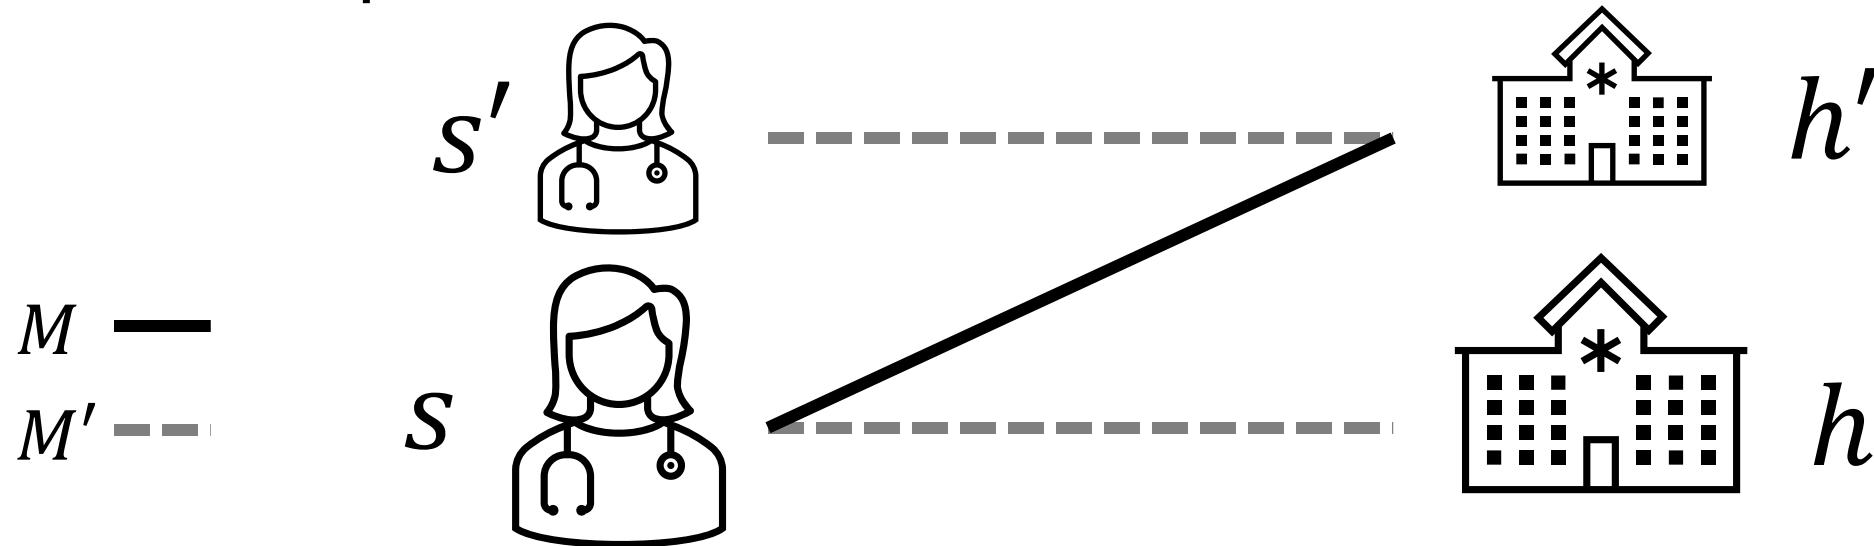

# Proof Idea Time!

---

**Proof:** ...

- Since  $h$  was rejected by  $s$ , it means that  $s$  prefers  $h'$  over  $h$
- Since  $h$  was the **first** rejected,  $h'$  did not get rejected and must prefer  $s$  to  $s'$

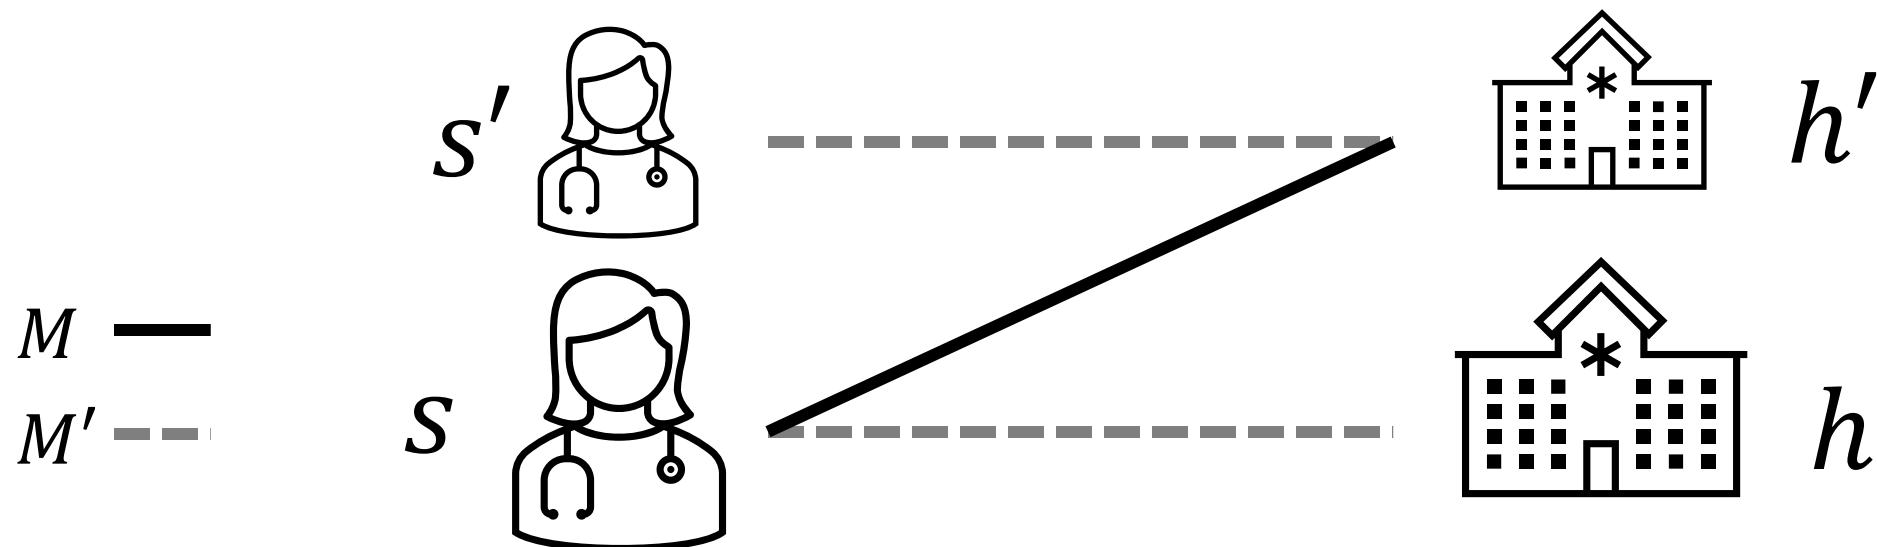

# Proof Idea Time!

---

**Proof:** ...

- Since  $h$  was rejected by  $s$ , it means that  $s$  prefers  $h'$  over  $h$

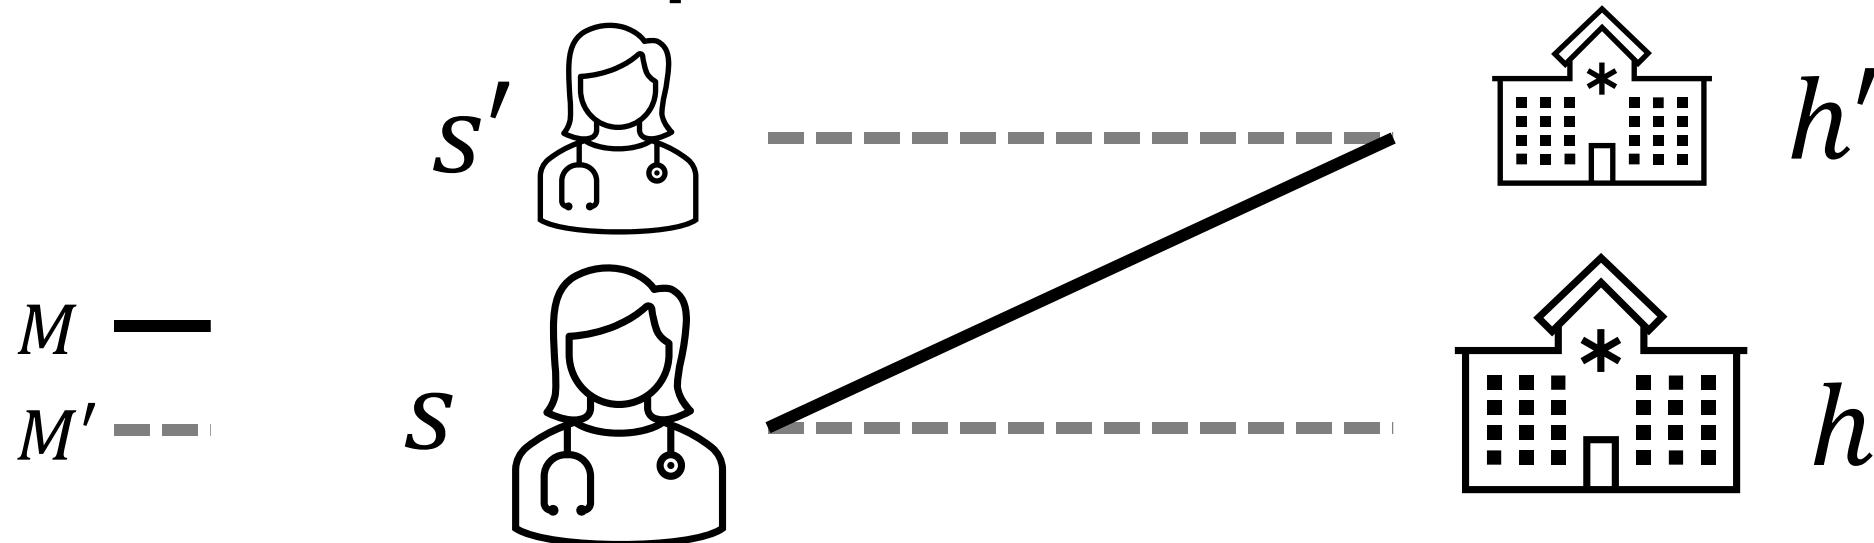

# Proof Idea Time!

---

**Proof:** ...

- Since  $h$  was rejected by  $s$ , it means that  $s$  **prefers  $h'$  over  $h$**
- Since  $h$  was the first rejected,  $h'$  did not get rejected and thus,  **$h'$  must prefer  $s$  to  $s'$**

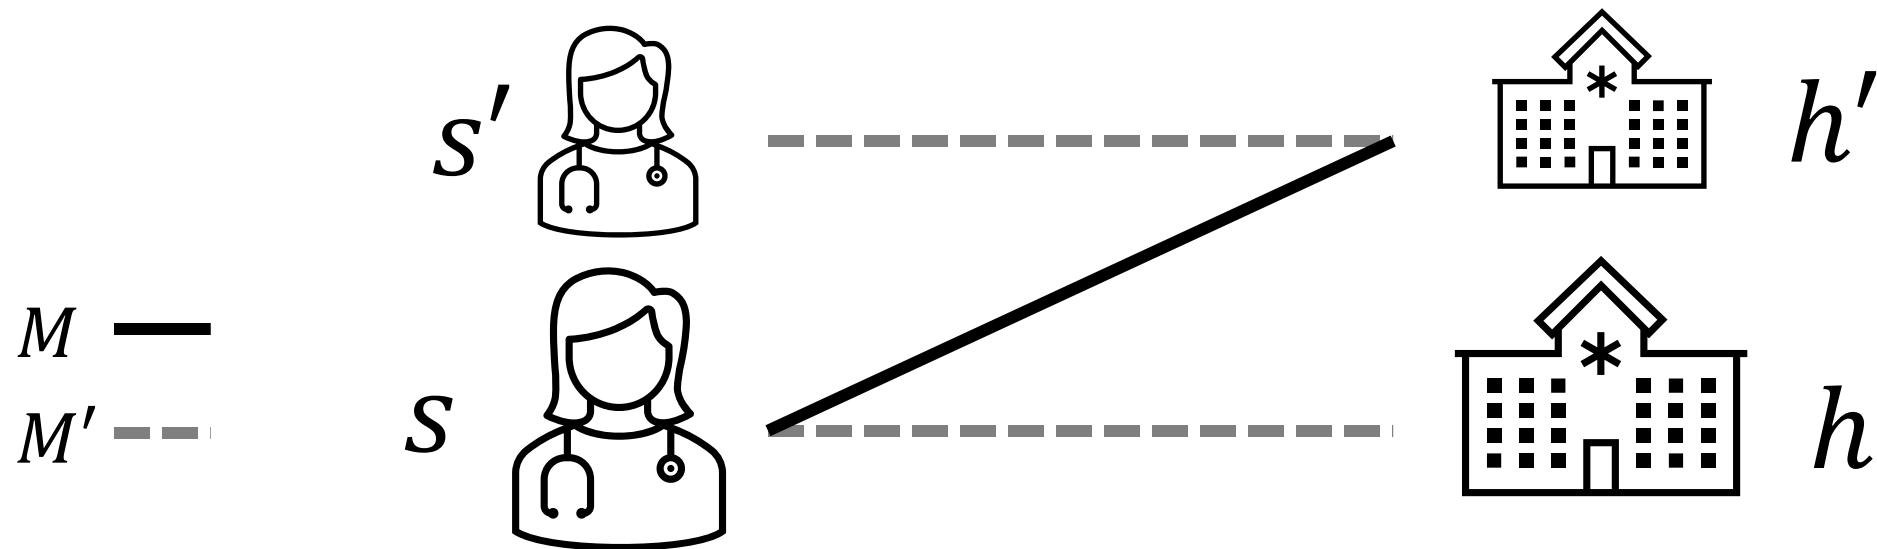

# Proof Idea Time!

---

Proof: ...

- If  $s$  prefers  $h'$  over  $h$  and  $h'$  must prefer  $s$  to  $s'$  then  $(h', s)$  is an unstable pair in  $M'$ . This is a contradiction!

# Claim Time!

---

**Claim:** The algorithm always outputs the *student-pessimal* assignment.

**WHILE** (some hospital  $h$  is unmatched and hasn't proposed to every student)

$s \leftarrow$  first student on  $h$ 's list to whom  $h$  has not yet proposed.

**IF** ( $s$  is unmatched)

Add  $h-s$  to matching  $M$ .

**ELSE IF** ( $s$  prefers  $h$  to current partner  $h'$ )

Replace  $h'-s$  with  $h-s$  in matching  $M$ .

**ELSE**

$s$  rejects  $h$ .

# Claim Time!

---

Each student gets their worst valid partner.

**Claim:** The algorithm always outputs the *student-pessimal* assignment.

**WHILE** (some hospital  $h$  is unmatched and hasn't proposed to every student)

$s \leftarrow$  first student on  $h$ 's list to whom  $h$  has not yet proposed.

**IF** ( $s$  is unmatched)

Add  $h-s$  to matching  $M$ .

**ELSE IF** ( $s$  prefers  $h$  to current partner  $h'$ )

Replace  $h'-s$  with  $h-s$  in matching  $M$ .

**ELSE**

$s$  rejects  $h$ .

# Proof Idea Time!

---

**Claim:** The algorithm always outputs a stable matching.

**Proof:**

- Suppose to the contrary that the output  $M$  is not **student-pessimal**.
  - Then there exists student  $s$  that is not matched with their worst valid partner  $h$  in  $M$ .

# Proof Idea Time!

---

**Claim:** The algorithm always outputs a stable matching.

**Proof:**

- Suppose to the contrary that the output  $M$  is not **student-pessimal**.
  - Then there exists student  $s$  that is not matched with their worst valid partner  $h$  in  $M$ .
  - Let  $M'$  be a stable matching such that  $s$  and  $h$  are matched.

# Proof Idea Time!

---

## Proof:

- Suppose to the contrary that the output  $M$  is not **student-pessimal**.
  - Then there exists student  $s$  that is not matched with their worst valid partner  $h$  in  $M$ .
  - Let  $M'$  be a stable matching such that  $s$  and  $h$  are matched.
  - Let  $h'$  be the hospital  $s$  is matched to in  $M$ .

# Proof Idea Time!

---

## Proof:

- Suppose to the contrary that the output  $M$  is not **student-pessimal**.
  - Then there exists student  $s$  that is not matched with their worst valid partner  $h$  in  $M$ .
  - Let  $M'$  be a stable matching such that  $s$  and  $h$  are matched.
- Let  $h'$  be the hospital  $s$  is matched to in  $M$ .
  - Then  $s$  prefers  $h'$  to  $h$ .

# Proof Idea Time!

---

## Proof:

- Let  $h'$  be the hospital  $s$  is matched to in  $M$ .
  - Then  $s$  prefers  $h'$  to  $h$  otherwise  $h$  would not be worst valid pair as assumed.
- Let  $s'$  be the hospital  $h$  is matched to in  $M$ .

# Proof Idea Time!

---

## Proof:

- Let  $h'$  be the hospital  $s$  is matched to in  $M$ .
  - Then  $s$  prefers  $h'$  to  $h$  otherwise  $h$  would not be worst valid pair as assumed.
- Let  $s'$  be the hospital  $h$  is matched to in  $M$ .
  - Since  $M$  is hospital-optimal,  $h$  prefers  $s$  to  $s'$ .

# Proof Idea Time!

---

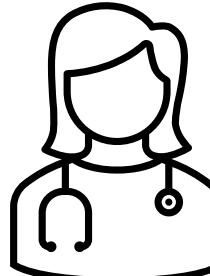

## Proof:

- Let  $h'$  be the hospital  $s$  is matched to in  $M$ .
  - Then  $s$  prefers  $h'$  to  $h$  otherwise  $h$  would not be worst valid pair as assumed.
- Let  $s'$  be the hospital  $h$  is matched to in  $M$ .
  - Since  $M$  is hospital-optimal,  $h$  prefers  $s$  to  $s'$ .
- Thus,  $(h, s)$  is an unstable pair in  $M$ . **<- Contradiction!**

# Q: Does it Help to Lie?
