

Binary Arithmetic -- Negative numbers and Subtraction

Binary Mathematics

Binary Addition: this is performed using the same rules as decimal except all numbers are limited to combinations of zeros (0) and ones (1).

Using 8-bit numbers

$$\begin{array}{r}
 1110_2 \\
 + 0000 0110_2 \\
 \hline
 0001 0100_2
 \end{array}
 \qquad
 \begin{array}{l}
 \text{which is} \\
 \text{which is}
 \end{array}
 \qquad
 \begin{array}{r}
 14_{10} \\
 + 6_{10} \\
 \hline
 20_{10}
 \end{array}$$

Not all integers are positive.

What about negative numbers?

What if we wanted to do: $14_{10} + (-2_{10}) = 12_{10}$

$$\text{So, : } 14_{10} + (-2_{10}) = 12_{10} \quad \leftrightarrow \quad 14_{10} - (+2_{10}) = 12_{10}$$

$$\begin{array}{r}
 14_{10} \\
 - 2_{10} \\
 \hline
 12_{10}
 \end{array}$$

This example is a deceptively easy because while there no need to borrow.
Let's look at another example:

$$\begin{array}{r}
 13 \\
 1\cancel{2}3_{10} \\
 - 19_{10} \\
 \hline
 104_{10}
 \end{array}$$

If we are using a paper and pencil, binary subtraction "can" be done using the same principles as decimal subtraction.

Binary Subtraction: Use standard mathematical rules:

$$\begin{array}{r}
 0000 1110_2 \\
 - 0000 0110_2 \\
 \hline
 0000 1000_2
 \end{array}
 \qquad
 \begin{array}{l}
 \text{which is} \\
 \text{which is}
 \end{array}
 \qquad
 \begin{array}{r}
 14_{10} \\
 - 6_{10} \\
 \hline
 8_{10}
 \end{array}$$

This is rather straightforward. In fact no borrowing was even required in this example.

This sign bit is **reserved** and is no longer one of the digits that make up the binary number. Remember if the sign bit is **zero (0)** the binary number following it is **positive**. If the sign bit is **one (1)** the binary number following it is **negative**.

Using the sign-magnitude system **the largest positive number** that can be stored by an 8-bit computer is:

$$\begin{array}{cccccccc} 0 & 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ \text{Sign} & (64) & (32) & (16) & (8) & (4) & (2) & (1) \end{array} = + 127_{10}$$

$$\text{This is: } 64 + 32 + 16 + 8 + 4 + 2 + 1 = 127_{10}$$

If there were a one (1) in the first bit, the number would be equal to $- 127_{10}$

$$\begin{array}{cccccccc} 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ \text{Sign} & (64) & (32) & (16) & (8) & (4) & (2) & (1) \end{array} = - 127_{10}$$

Over time it has become obvious that a system that even further reduces the number of available bits while meaningful, is not especially useful.

Then of course there is still the problem of how to deal with these positive and negative numbers. While this representation is simple, arithmetic is suddenly impossible. The standard rules of arithmetic don't apply. Creating a whole new way to perform arithmetic isn't overly realistic.

Fortunately another technique is available.

Two's Complement

Two's complement is an alternative way of representing negative binary numbers. This alternative coding system also has the unique property that subtraction (or the addition of a negative number) can be performed using addition hardware. Architects of early computers were thus able to build arithmetic and logic units that performed operations of addition and subtraction using only adder hardware. (As it turns out since multiplication is just successive addition and division is just successive subtraction it was possible to use simple adder hardware to perform all of these operations.)

Let's look at an example:

$$14_{10} - 6_{10} = 14_{10} + (-6_{10}) = 8_{10}$$

$$0000\ 1110_2 + 1000\ 0110_2 = ?_2$$

$\left| \begin{array}{l} 0000\ 1110_2 \\ \text{left-most digit is } 0 \\ \text{number is } \text{positive} \end{array} \right. + \left. \begin{array}{l} 1000\ 0110_2 \\ \text{left-most digit is } 1, \text{ number is } \text{negative} \end{array} \right. = ?_2$

Step 1: Decide how many bits you are going to use for all your operations. For our purposes we will always use 8 bits.

If we were using 8-bits the left-most bit will contain the sign. This would leave 7 bits to hold the number.

X X X X X X X X
|
This is the sign bit

This sign bit is **reserved** and is no longer one of the digits that make up the binary number. Using two's complement, the computer recognizes the presence of a one (1) in the leftmost bit which tells the machine that before it does mathematics it needs to convert negative numbers into their two's complement equivalent.

0000 1110₂ the sign bit is 0 so the number is **positive**
The binary number is 7-digits long,

1000 0110₂ the sign bit is **1** so the number is **negative**
The binary number is only 7-digits long,

Example 1:

$$14_{10} - 6_{10} = 14_{10} + (-6_{10}) = 8_{10}$$

$$0000\ 1110_2 + 1000\ 0110_2 = ?_2$$

|
left-most digit is 0
number is **positive**

|
left-most digit is 1, number is **negative**

Step 2: Strip the sign bits off the numbers.

Step 3: Convert the negative number into it's two's complement form.

Note: If neither of the number were negative we would be doing simple addition and this would not be necessary.

How do we find the two's complement of -6?

Write down the number without the sign bit	-----	000 0110 ₂
a) Flip all the digits		111 1001 ₂
The 1 → 0, the 0 → 1		+ 1
b) Add 1 to this number		-----
		111 1010 ₂
c) This is now - 6 in the two's complement format		

Step 4: **Add** the two's complement in place of the negative number.

So, 14 ₁₀	000 1110 ₂	
+ (-6 ₁₀)	+111 1010 ₂	in two's complement format
-----	-----	
8 ₁₀	1 000 1000	
		this is the positive number 8 in binary
		Overflow bit IGNORE

IT Worked!

The basic computational process is the same. Negative numbers are converted to their two's complement equivalent. But since the resulting number is negative, rather than positive, two's complement is used again to convert the number back to standard binary.

Example 4:

$$9_{10} - 14_{10} = 9_{10} + (-14_{10}) = -5$$

Decimal	Standard Binary	
9 ₁₀	0000 1001 ₂	left-most digit says positive
+ (-14 ₁₀)	+ 1000 1110 ₂	left-most digit says negative
-----	-----	
- 5 ₁₀		

Step 1: Decide on the number of binary digits -- Choose 8

Step 2: Strip off the sign bits.

Step 3: Convert the negative number to its two's complement equivalent.

Write down the negative number without sign bit	000 1110 ₂
A) Flip the digits	111 0001 ₂
B) Add one (1)	+ 1

C) This is two's complement	111 0010 ₂

Step 4: Add the two numbers together.

9 ₁₀	000 1001 ₂	
+ (-14 ₁₀)	+ 111 0010 ₂	in two's complement format
-----	-----	
	111 1011 ₂	no overflow, this says result is still in two's complement form

Step 5: Convert from two's complement by doing the two's complement process again.

Write down the number	111 1011 ₂
A) Flip the digits	000 0100 ₂
B) Add one (1)	+ 1

C) This is two's complement	000 0101 ₂ positive 5, in standard binary
D) We know the result	
Is negative, change sign bit	1000 0101 ₂ negative 5, in standard binary

Example 5:

$$-25 + 18 = -7$$

Proceed the same way, converting the negative number to it's two's complement equivalent.

Decimal	Standard Binary	
- 25 ₁₀	1001 1001 ₂	left-most digit says negative
+ 18 ₁₀	+ 0001 0010 ₂	left-most digit says positive
-----	-----	
- 7 ₁₀		

Step 1: Decide on the number of binary digits -- Choose 8

Step 2: Strip off the sign bit.

Step 3: Convert the negative number to it's twos complement equivalent.

Write down the negative number Without the sign bit	001 1001 ₂
A) Flip the digits	110 0110 ₂
B) Add one (1)	+ 1

C) This is two's complement	110 0111 ₂

Step 4: Add the two numbers together.

- 25 ₁₀	110 0111 ₂	in two's complement format
+ 18 ₁₀	+ 001 0010 ₂	
-----	-----	
	111 1001 ₂	no overflow, this says result is still in two's complement form

Step 5: Convert from two's complement by doing the two's complement process again.

Write down the number	111 1001 ₂	
A) Flip the digits	000 0110 ₂	
B) Add one (1)	+ 1	

C) This is two's complement	000 0111 ₂	positive 7, in standard binary
D) We know the result Is negative, change sign bit	1000 1110 ₂	negative 7, in standard binary

Try these problems:

$$\begin{aligned} 1) \quad 9_{10} - 7_{10} &= 2_{10} \\ 9_{10} + (-7_{10}) &= 2_{10} \end{aligned}$$

$$0000\ 1001 + 1000\ 0111 =$$

$$\begin{aligned} 2) \quad 17_{10} - 12_{10} &= 5_{10} \\ 17_{10} + (-12_{10}) &= 5_{10} \end{aligned}$$

$$0001\ 0001 + 1000\ 1100 =$$

$$\begin{aligned} 3) \quad 18_{10} - 22_{10} &= -4_{10} \\ 18_{10} + (-22_{10}) &= -4_{10} \end{aligned}$$

$$0001\ 0010 + 1001\ 0110 =$$

$$\begin{aligned} 4) \quad 7_{10} - 19_{10} &= -12_{10} \\ 7_{10} + (-19_{10}) &= -12_{10} \end{aligned}$$

$$0000\ 0111 + 1001\ 0011 =$$

$$5) \quad -26_{10} + 10_{10} = -16_{10}$$

$$1001\ 1010 + 0000\ 1010 =$$

$$6) \quad -19_{10} + 6_{10} = -13_{10}$$

$$1001\ 0011 + 0000\ 0110 =$$

Solutions:

1) $9_{10} - 7_{10} = 2_{10}$
 This is the same as
 $9_{10} + (-7_{10}) = 2_{10}$

$$0000\ 1001 + 1000\ 0111 =$$

Strip the sign bit.

Convert the negative number to it's 2's complement equivalent

$$\begin{array}{rcl}
 1000\ 0111 & \xrightarrow{\text{Flip the digits}} & 000\ 0111 \\
 & & 111\ 1000 \\
 & & + 1 \\
 \hline
 & \text{This is 2's comp} & 111\ 1001
 \end{array}$$

Now add the numbers

$$\begin{array}{r}
 000\ 1001 \\
 + 111\ 1001 \\
 \hline
 1\ 000\ 0010 \\
 \text{ignore overflow}
 \end{array}$$

= 2_{10}

2) $17_{10} - 12_{10} = 5_{10}$
 This is the same as
 $17_{10} + (-12_{10}) = 5_{10}$

$$0001\ 0001 + 1000\ 1100 =$$

Strip the sign bit.

Convert the negative number to it's 2's complement equivalent

$$\begin{array}{rcl}
 1000\ 1100 & \xrightarrow{\text{Flip the digits}} & 000\ 1100 \\
 & & 111\ 0011 \\
 & & + 1 \\
 \hline
 & \text{This is 2's comp} & 111\ 0100
 \end{array}$$

Now add the numbers

$$\begin{array}{r}
 001\ 0001 \\
 + 111\ 0100 \\
 \hline
 1\ 000\ 0101 \\
 \text{ignore overflow}
 \end{array}$$

= 5_{10}

Now add the numbers

$$\begin{array}{r} 000\ 0111 \\ +\ 110\ 1101 \\ \hline 111\ 0100 \end{array}$$

No Overflow

This is still in 2's complement

Apply 2's complement to number again

$$\begin{array}{r} 111\ 0100 \\ \text{Flip the digits} \\ 000\ 1011 \\ \text{Add one(1)} \\ +\ 1 \end{array}$$

Put the sign bit back on
we know the number
is negative

$$\begin{array}{r} 1000\ 1100 \\ \hline -12_{10} \end{array}$$

- 5) $-26_{10} + 10_{10} = -16_{10}$ $1001\ 1010 + 0000\ 1010 =$
Strip the sign bits. Convert the negative number to it's 2's complement equivalent.

$$\begin{array}{r} 1001\ 1010 \xrightarrow{\text{Flip the digits}} 001\ 1010 \\ \text{Add one(1)} \\ 110\ 0101 \\ \hline 110\ 0110 \end{array}$$

This is 2's comp

Now add the numbers

$$\begin{array}{r} 110\ 0110 \\ +\ 000\ 1010 \\ \hline 111\ 0000 \end{array}$$

No Overflow

This is still in 2's complement

Apply 2's complement to number again

$$\begin{array}{r} 111\ 0000 \\ \text{Flip the digits} \\ 000\ 1111 \\ \text{Add one(1)} \\ +\ 1 \end{array}$$

Put the sign bit back on
we know the number
is negative

$$\begin{array}{r} 1001\ 0000 \\ \hline -16_{10} \end{array}$$

$$6) \quad -19_{10} + 6_{10} = -13_{10} \qquad 1001\ 0011 + 0000\ 0110 =$$

Convert the negative number to its 2's complement equivalent

$$\begin{array}{rcl}
 1001\ 0011 & \longrightarrow & 001\ 0011 \\
 & \text{Flip the digits} & 110\ 1100 \\
 & \text{Add one(1)} & \quad + 1 \\
 & & \hline
 & \text{This is 2's comp} & 110\ 1101
 \end{array}$$

Now add the numbers

$$\begin{array}{r}
 110\ 1101 \\
 + 000\ 0110 \\
 \hline
 111\ 0011
 \end{array}$$

No Overflow

This is still in 2's complement

Apply 2's complement to number again

$$\begin{array}{rcl}
 & & 111\ 0011 \\
 & \text{Flip the digits} & 000\ 1100 \\
 & \text{Add one(1)} & \quad + 1 \\
 & & \hline
 \end{array}$$

$$\begin{array}{r}
 \text{Put the sign bit back on} \\
 \text{we know the number} \\
 \text{is negative} \\
 \hline
 1000\ 1101 \\
 \hline
 -13_{10}
 \end{array}$$
