

CSE 491/596 Lecture Fri 10/28/22 (continued).

Example Problem: INDEPENDENT SET:

INSTANCE: A graph  $G$  and a number  $K > 0$

QUESTION: Do there exist (at least)  $K$  independent vertices, i.e. no pair connected by an edge?

This is in NP. To show it NP-complete, show  $3SAT \leq_m^p \text{INDSET}$

$\phi \xrightarrow{f} \langle G, K \rangle$  I.e. we map

$C_1 \wedge C_2 \wedge \dots \wedge C_j \wedge \dots \wedge C_m$  in  $n$  variables  $x_1, \dots, x_n$   $\xrightarrow{f}$   $G = (V, E)$  and a number  $K$  that usually depends on  $n$ .

Such that  $\phi$  has a sat. asgmt  $\iff G$  has an ind. set of size  $K$ .

⋮

$C_1$

$C_2$

⋮

$C_m$

And take  $K = m + n$  which is the max possible ind. set size with the blue edges present.
