$$Y \leq_p X$$

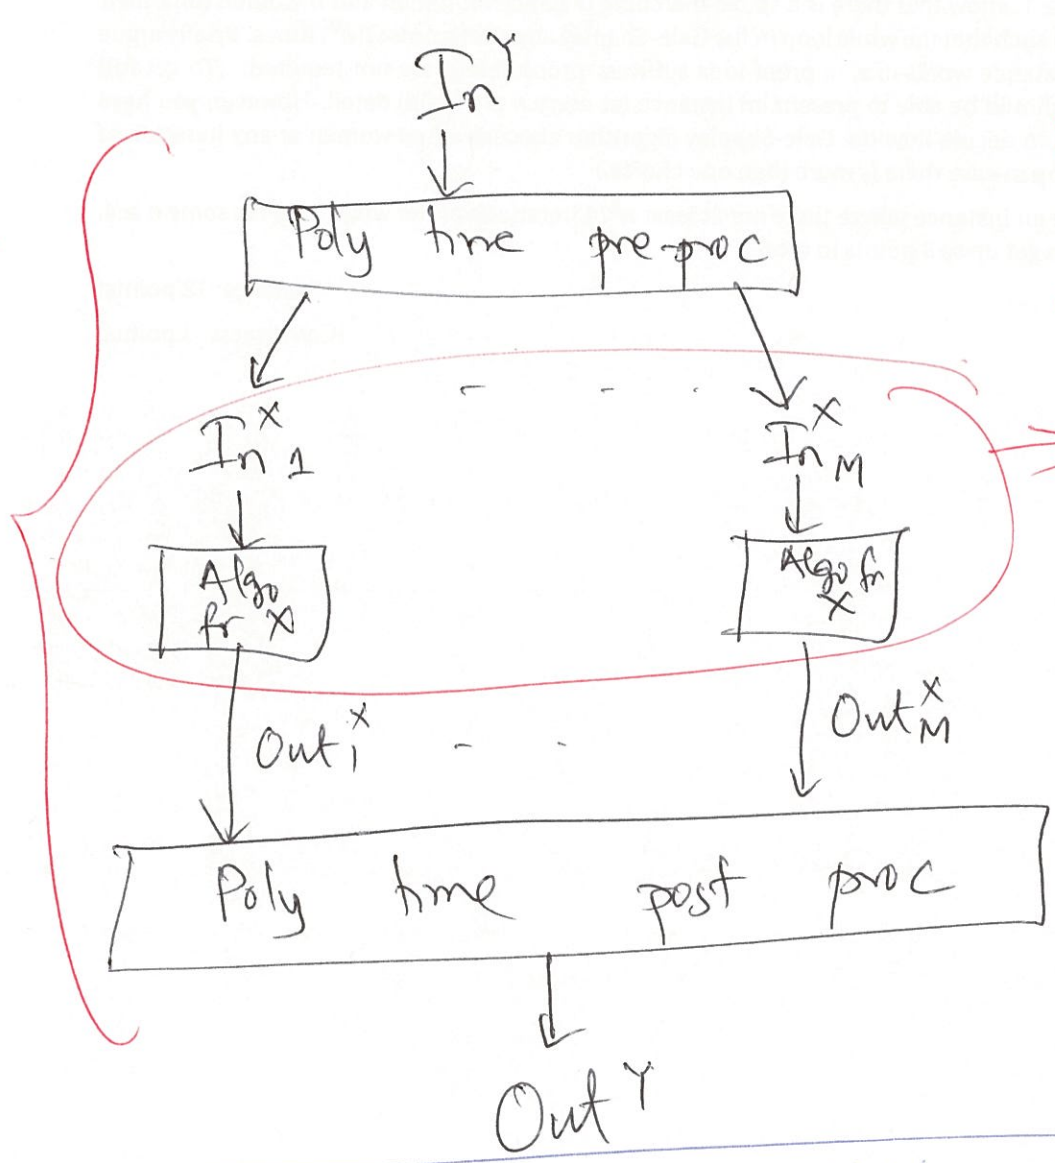

$\Rightarrow Y$  is poly time reducible to  $X$

$\equiv \exists$  a poly time redun from  $Y$  to  $X$

Solve!

$$In^Y \dots \rightarrow Out^Y$$

so for  $M=1$

$$M = \text{poly}(N)$$

Input size of  $Y = N$

Algo for  $X$  is poly time

$\Rightarrow$

$$M \cdot \text{poly}(N) = \text{poly}(N)$$

Example!

HW 2 Q2  $\leq_p$  Stable matching ( $M=1$ )

Going forward: ONLY consider problems with Boolean Output.

Problem! Independent Set (IS)

Q7 HW7 special case of G being a path

$G = (V, E)$

Def: An IS of G is a subset  $S \subseteq V$  s.t NO edges exist between ANY  $u \neq v \in V$

- $\{1, 4\} \checkmark$      $\{3, 7\} \times$
- $\{1, 4, 7\} \times$      $\{3, 4, 5\} \checkmark$
- $\{1, 4, 5, 6\} \checkmark$      $(=|V|)$

Formal problem! Input:  $G = (V, E)$  ;  $0 \leq k \leq n$

Output: TRUE iff  $\exists$  an IS of size  $\geq k$ .

Examples:  $G_0; 2 \checkmark$      $G_0; 3 \checkmark$      $G_0; 4 \checkmark$      $G_0; 5 \times$

Note: Every subset of an IS is also an IS

Problem 2: Vertex Cover

$G = (V, E)$  ;  $C \subseteq V$  is a vertex cover (VC) if ALL edges  $e \in E$  has at least one end point in C.

Examples:  $G_0$  :  $\{1, 2, 3, 4, 5, 6, 7\} \checkmark$   
 $\{1, 2, 3, 4, 5, 6\} \checkmark$      $\{1, 2, 6, 7\} \checkmark$   
 $\{3, 7\} \checkmark$      $\{1, 7\} \times$      $\{1, 3, 7\} \times$

Lemma! Let  $G = (V, E)$  .  $\exists S \subseteq V$  is an IS  $\iff V \setminus S$  is a VC

Formal problem! Input:  $G = (V, E)$  ;  $0 \leq k \leq n$

Output: TRUE iff G has a VC of size  $\leq k$ .  
 $G_0; 6 \checkmark$      $G_0; 3 \checkmark$      $G_0; 2 \times$

THM: (1)  $IS \leq_p VC$  (2)  $VC \leq_p IS$

↖ pf on Friday

Recall: Problem  $Y$  with output  $\{0,1\}$

$\equiv Y$  is a subset of all possible inputs with output = 1.

{note: if  $w \notin Y \Rightarrow$  output for  $Y = 0$ }

Algorithmic problem: Given an input  $w$

is  $w \in Y$ ?

Eg:  $w = G; k$   
 $Y =$  set of all  $G$  with an IS of size  $\geq k$ .

Def: Given an algo  $A$  & input  $w$   
 $A(w)$  as its output.  
 $\in \{0,1\}$

Def: An algo  $A$  solves the problem  $Y$  if  
 $\forall$  inputs  $w$   $A(w) = 1 \iff w \in Y$

Recall:  $A$  is poly time if  $\forall$  inputs  $w$ ,  $A(w)$   
can be computed in  $\text{poly}(|w|)$  time  
 $|w| = N$   
 $\text{poly}(N) = N^c$

DEF:  $\mathcal{P}$ : set of all problems that  
can be solved by a poly time algo.  
for some constant  $c$

Q: Is the shortest path problem  $\in \mathcal{P}$ ?

( i/p:  $G, s, t$  o/p: cost of shortest  $s-t$  path? )  
NO: since output is not in  $\{0,1\}$

i/p:  $G, s, t, k$  o/p: TRUE if  $\exists$  an  $s-t$  path of cost  $\leq k$ .

# Efficient verification (book: certification)

Q: Is  $w \in Y$

Eg:  $Y$  is IS  
 $w = G; k$

↳ A certificate/witness is a string that supports the claim that  $w \in Y$

Def:  $B$  is an efficient verifier for  $Y$  if

①  $B$  takes as input  $w$ ,  $t$  & outputs  $B(w, t) \in \{0, 1\}$   
 $w$  → input  $t$  ← witness

②  $B$  runs in time  $\text{poly}(|w|)$

③  $w \in Y \iff \exists$  a string/witness  $t$  s.t. (i)  $|t| \leq \text{poly}(|w|)$  AND (ii)  $B(w, t) = 1$

E.g.  $Y = \text{IS}$  i/p:  $G; k$

Witness:  $S \subseteq V$  of size  $|S| = k$

Q:  $\exists$  an efficient verifier
