# Minimum Spanning Tree Problem

**Input:** Undirected, connected  $G = (V, E)$ , edge costs  $c_e$

**Output:** Subset  $E' \subseteq E$ , s.t.  $T = (V, E')$  is connected  
 $C(T)$  is minimized

If all  $c_e > 0$ , then  $T$  is indeed a tree

# Prim's algorithm

Robert Prim

Similar to Dijkstra's algorithm

Input:  $G=(V,E)$ ,  $c_e > 0$  for every  $e$  in  $E$

$S = \{s\}$ ,  $T = \emptyset$

While  $S$  is not the same as  $V$

Among edges  $e = (u,w)$  with  $u$  in  $S$  and  $w$  not in  $S$ , pick one with minimum cost

Add  $w$  to  $S$ ,  $e$  to  $T$

# Cut Property Lemma for MSTs

Condition:  $S$  and  $V \setminus S$  are non-empty

Cheapest crossing edge is in **all** MSTs

Assumption: All edge costs are distinct

# Today's agenda

Optimality of Prim's algorithm

Prove Cut Property Lemma

Optimality of Kruskal's algorithm

Remove distinct edge weights assumption

# Kruskal's Algorithm

Input:  $G=(V,E)$ ,  $c_e > 0$  for every  $e$  in  $E$

$T = \emptyset$

Sort edges in increasing order of their cost

Consider edges in sorted order

If an edge can be added to  $T$  without adding a cycle then add it to  $T$

Joseph B. Kruskal

# Optimality of Kruskal's Algorithm

Nodes connected to red in  $(V, T)$

Input:  $G=(V,E)$ ,  $c_e > 0$  for every  $e$  in  $E$

$T = \emptyset$

Sort edges in increasing order of their cost

Consider edges in sorted order

If an edge can be added to  $T$  without adding a cycle then add it to  $T$

$S$  is non-empty

$V \setminus S$  is non-empty

First crossing edge considered

# Is $(V, T)$ a spanning tree?

No cycles by design

Just need to show that  $(V, T)$  is connected

$G$  is  
disconnected!

No edges here

# Removing distinct cost assumption

Change all edge weights by very small amounts

Make sure that all edge weights are distinct

MST for “perturbed” weights is the same as for original

Changes have to be small enough so that this holds

Figure out how to change costs

# Run time for Prim's algorithm

Similar to Dijkstra's algorithm

$O(m \log n)$

Input:  $G=(V,E)$ ,  $c_e > 0$  for every  $e$  in  $E$

$S = \{s\}$ ,  $T = \emptyset$

While  $S$  is not the same as  $V$

Among edges  $e = (u,w)$  with  $u$  in  $S$  and  $w$  not in  $S$ , pick one with minimum cost

Add  $w$  to  $S$ ,  $e$  to  $T$

# Running time for Kruskal's Algorithm

Can be implemented in  $O(m \log n)$  time (Union-find DS)

Input:  $G=(V,E)$ ,  $c_e > 0$  for every  $e$  in  $E$

$T = \emptyset$

Sort edges in increasing order of their cost

Consider edges in sorted order

If an edge can be added to  $T$  without adding a cycle then add it to  $T$

$O(m^2)$  time overall

Joseph B. Kruskal

Can be verified in  $O(m+n)$  time
