## Interval Partitioning

**Input:**  $n$  jobs, job  $i$  with start time  $s_i$  and finish time  $f_i$

$i$  and  $j$  are **compatible** if  $[s_i, f_i)$  and  $[s_j, f_j)$  are disjoint

**Output:** A minimum number of machines to schedule all jobs so that all jobs on a single machine are compatible.

## Interval Partitioning

**Input:**  $n$  jobs, job  $i$  with start time  $s_i$  and finish time  $f_i$

$i$  and  $j$  are **compatible** if  $[s_i, f_i)$  and  $[s_j, f_j)$  are disjoint

**Output:** A minimum number of machines to schedule all jobs so that all jobs on a single machine are compatible.

# Greedy Algorithm for Interval Partitioning

**Lemma** It is safe to schedule the job  $j$  with the earliest starting time to a earliest-finished machine: There exists an optimum solution where job  $j$  with the earliest starting time is scheduled first on the earliest-finished machine that is compatible with all jobs in that machine if applicable; otherwise, it can be scheduled by opening a new machine.

Proof.

**Def.** The **depth** of a set of jobs is the maximum number of overlapping jobs at any point within the given set.

# Greedy Algorithm for Interval Partitioning

**Def.** The **depth** of a set of jobs is the maximum number of overlapping jobs at any point within the given set.

**Obs.** The number of machines  $\geq$  the depth of the jobs.

# Greedy Algorithm for Interval Partitioning

**Def.** The **depth** of a set of jobs is the maximum number of overlapping jobs at any point within the given set.

**Obs.** The number of machines  $\geq$  the depth of the jobs.

**Obs.** Greedy algorithm never schedules two incompatible jobs in the same machine.

Why “Greedy algorithm” is optimal?

**Theorem** Greedy algorithm is optimal.

**Proof.**

- Let  $d$  be the number of machines that greedy algorithm used.

Why “Greedy algorithm” is optimal?

**Theorem** Greedy algorithm is optimal.

**Proof.**

- Let  $d$  be the number of machines that greedy algorithm used.
- $d$ -th machine is opened because the greedy algorithm need to schedule a job, wlog, say job  $j$ , such that job  $j$  is incompatible with all the last scheduled jobs in the  $d - 1$  other machines. In other words, these  $d - 1$  job each ends after  $s_j$ .

Why “Greedy algorithm” is optimal?

**Theorem** Greedy algorithm is optimal.

**Proof.**

- Let  $d$  be the number of machines that greedy algorithm used.
- $d$ -th machine is opened because the greedy algorithm need to schedule a job, wlog, say job  $j$ , such that job  $j$  is incompatible with all the last scheduled jobs in the  $d - 1$  other machines. In other words, these  $d - 1$  job each ends after  $s_j$ .
- Observation: all these  $d - 1$  jobs starts earlier than  $s_j$  because we schedule the jobs in order of starting time. Thus, we have  $d$  jobs overlapping at time  $s_j + \epsilon$ . The jobs **depth**  $\geq d$ .

Why “Greedy algorithm” is optimal?

**Theorem** Greedy algorithm is optimal.

**Proof.**

- Let  $d$  be the number of machines that greedy algorithm used.
- $d$ -th machine is opened because the greedy algorithm need to schedule a job, wlog, say job  $j$ , such that job  $j$  is incompatible with all the last scheduled jobs in the  $d - 1$  other machines. In other words, these  $d - 1$  job each ends after  $s_j$ .
- Observation: all these  $d - 1$  jobs starts earlier than  $s_j$  because we schedule the jobs in order of starting time. Thus, we have  $d$  jobs overlapping at time  $s_j + \epsilon$ . The jobs **depth**  $\geq d$ .
- By the Observation in the previous slide, an optimal solution  $\geq d$ . Thus the greedy algorithm is optimal.
