## Offline Caching

- Cache that can store $k$ pages
- Sequence of page requests
- Cache miss happens if requested page not in cache. We need bring the page into cache, and evict some existing page if necessary.
- Cache hit happens if requested page already in cache.
- Goal: minimize the number of cache misses.

## A Better Solution for Example

## Offline Caching Problem

Input: $k$ : the size of cache $n$ : number of pages

$$
\text { We use }[n] \text { for }\{1,2,3, \cdots, n\} .
$$

$\rho_{1}, \rho_{2}, \rho_{3}, \cdots, \rho_{T} \in[n]$ : sequence of requests
Output: $i_{1}, i_{2}, i_{3}, \cdots, i_{T} \in\{$ hit, empty $\} \cup[n]$ : indices of pages to evict ("hit" means evicting no page, "empty" means evicting empty page)

## Offline Caching Problem

Input: $k$ : the size of cache
$n$ : number of pages
We use $[n]$ for $\{1,2,3, \cdots, n\}$. $\rho_{1}, \rho_{2}, \rho_{3}, \cdots, \rho_{T} \in[n]$ : sequence of requests
Output: $i_{1}, i_{2}, i_{3}, \cdots, i_{T} \in\{$ hit, empty $\} \cup[n]$ : indices of pages to evict ("hit" means evicting no page, "empty" means evicting empty page)

- Offline Caching: we know the whole sequence ahead of time.
- Online Caching: we have to make decisions on the fly, before seeing future requests.

## Offline Caching Problem

Input: $k$ : the size of cache
$n$ : number of pages
We use $[n]$ for $\{1,2,3, \cdots, n\}$.
$\rho_{1}, \rho_{2}, \rho_{3}, \cdots, \rho_{T} \in[n]$ : sequence of requests
Output: $i_{1}, i_{2}, i_{3}, \cdots, i_{T} \in\{$ hit, empty $\} \cup[n]$ : indices of pages to evict ("hit" means evicting no page, "empty" means evicting empty page)

- Offline Caching: we know the whole sequence ahead of time.
- Online Caching: we have to make decisions on the fly, before seeing future requests.

Q: Which one is more realistic?

## Offline Caching Problem

Input: $k$ : the size of cache
$n$ : number of pages

$$
\text { We use }[n] \text { for }\{1,2,3, \cdots, n\} .
$$

$\rho_{1}, \rho_{2}, \rho_{3}, \cdots, \rho_{T} \in[n]$ : sequence of requests
Output: $i_{1}, i_{2}, i_{3}, \cdots, i_{T} \in\{$ hit, empty $\} \cup[n]$ : indices of pages to evict ("hit" means evicting no page, "empty" means evicting empty page)

- Offline Caching: we know the whole sequence ahead of time.
- Online Caching: we have to make decisions on the fly, before seeing future requests.

Q: Which one is more realistic?

A: Online caching

- Offline Caching: we know the whole sequence ahead of time.
- Online Caching: we have to make decisions on the fly, before seeing future requests.

Q: Which one is more realistic?

A: Online caching

Q: Why do we study the offline caching problem?

- Offline Caching: we know the whole sequence ahead of time.
- Online Caching: we have to make decisions on the fly, before seeing future requests.

Q: Which one is more realistic?

A: Online caching

Q: Why do we study the offline caching problem?

A: Use the offline solution as a benchmark to measure the "competitive ratio" of online algorithms

## Offline Caching: Potential Greedy Algorithms

- FIFO(First-In-First-Out): Evict the first-in page in cache

## Offline Caching: Potential Greedy Algorithms

- FIFO(First-In-First-Out): Evict the first-in page in cache
- LRU(Least-Recently-Used): Evict page whose most recent access was earliest

## Offline Caching: Potential Greedy Algorithms

- FIFO(First-In-First-Out): Evict the first-in page in cache
- LRU(Least-Recently-Used): Evict page whose most recent access was earliest
- LFU(Least-Frequently-Used): Evict page that was least frequently requested

## Offline Caching: Potential Greedy Algorithms

- FIFO(First-In-First-Out): Evict the first-in page in cache
- LRU(Least-Recently-Used): Evict page whose most recent access was earliest
- LFU(Least-Frequently-Used): Evict page that was least frequently requested
- LIFO (Last In First Out): Evict the last-in page in cache

## Offline Caching: Potential Greedy Algorithms

- FIFO(First-In-First-Out): Evict the first-in page in cache
- LRU(Least-Recently-Used): Evict page whose most recent access was earliest
- LFU(Least-Frequently-Used): Evict page that was least frequently requested
- LIFO (Last In First Out): Evict the last-in page in cache
- All the above algorithms are not optimum!
- Indeed all the algorithms are "online", i.e, the decisions can be made without knowing future requests. Online algorithms can not be optimum.

## Optimum Offline Caching

## Furthest-in-Future (FF)

- Algorithm: every time, evict the page that is not requested until furthest in the future, if we need to evict one.
- The algorithm is not an online algorithm, since the decision at a step depends on the request sequence in the future.

## Furthest-in-Future (FF)

## Recall: Designing and Analyzing Greedy Algorithms

## Greedy Algorithm

- Build up the solutions in steps
- At each step, make an irrevocable decision using a "reasonable" strategy

## Analysis of Greedy Algorithm

- Safety: Prove that the reasonable strategy is "safe" (key)
- Self-reduce: Show that the remaining task after applying the strategy is to solve a (many) smaller instance(s) of the same problem (usually easy)

Lemma Assume at time 1 a page fault happens and there are no empty pages in the cache. Let $p^{*}$ be the page in cache that is not requested until furthest in the future. It is safe to evict $p^{*}$ at time 1.

Analysis of Greedy Algorithm

- Safety: Prove that the reasonable strategy is "safe" (key)
- Self-reduce: Show that the remaining task after applying the strategy is to solve a (many) smaller instance(s) of the same problem (usually easy)

Lemma Assume at time 1 a page fault happens and there are no empty pages in the cache. Let $p^{*}$ be the page in cache that is not requested until furthest in the future. There is an optimum solution in which $p^{*}$ is evicted at time 1.

## Proof.

(1) $S$ : any optimum solution
(2) $p^{*}$ : page in cache not requested until furthest in the future.

- In the example, $p^{*}=3$.

## Proof.

(1) $S$ : any optimum solution
(2) $p^{*}$ : page in cache not requested until furthest in the future.

- In the example, $p^{*}=3$.
(3) Assume $S$ evicts some $p^{\prime} \neq p^{*}$ at time 1 ; otherwise done.
- In the example, $p^{\prime}=2$.

## Proof.

(1) $S$ : any optimum solution
(2) $p^{*}$ : page in cache not requested until furthest in the future.

- In the example, $p^{*}=3$.
(3) Assume $S$ evicts some $p^{\prime} \neq p^{*}$ at time 1 ; otherwise done.
- In the example, $p^{\prime}=2$.

## Proof.

## Proof.

(9) Create $S^{\prime} \cdot S^{\prime}$ evicts $p^{*}(=3)$ instead of $p^{\prime}(=2)$ at time 1 .

## Proof.

(9) Create $S^{\prime} \cdot S^{\prime}$ evicts $p^{*}(=3)$ instead of $p^{\prime}(=2)$ at time 1 .

## Proof.

(4) Create $S^{\prime} . S^{\prime}$ evicts $p^{*}(=3)$ instead of $p^{\prime}(=2)$ at time 1 .
(5) After time 1 , cache status of $S$ and that of $S^{\prime}$ differ by only 1 page. $S^{\prime}$ contains $p^{\prime}(=2)$ and $S$ contains $p^{*}(=3)$.

## Proof.

(4) Create $S^{\prime} . S^{\prime}$ evicts $p^{*}(=3)$ instead of $p^{\prime}(=2)$ at time 1 .
(5) After time 1 , cache status of $S$ and that of $S^{\prime}$ differ by only 1 page. $S^{\prime}$ contains $p^{\prime}(=2)$ and $S$ contains $p^{*}(=3)$.
(0) From now on, $S^{\prime}$ will "copy" $S$.

## Proof.

(4) Create $S^{\prime} . S^{\prime}$ evicts $p^{*}(=3)$ instead of $p^{\prime}(=2)$ at time 1 .
(5) After time 1 , cache status of $S$ and that of $S^{\prime}$ differ by only 1 page. $S^{\prime}$ contains $p^{\prime}(=2)$ and $S$ contains $p^{*}(=3)$.
(0) From now on, $S^{\prime}$ will "copy" $S$.

(0) From now on, $S^{\prime}$ will "copy" $S$.

## Proof.

(9) Create $S^{\prime} . S^{\prime}$ evicts $p^{*}(=3)$ instead of $p^{\prime}(=2)$ at time 1 .
(5) After time 1 , cache status of $S$ and that of $S^{\prime}$ differ by only 1 page. $S^{\prime}$ contains $p^{\prime}(=2)$ and $S$ contains $p^{*}(=3)$.
(0) From now on, $S^{\prime}$ will "copy" $S$.

## Proof.

(4) Create $S^{\prime} . S^{\prime}$ evicts $p^{*}(=3)$ instead of $p^{\prime}(=2)$ at time 1 .
(5) After time 1 , cache status of $S$ and that of $S^{\prime}$ differ by only 1 page. $S^{\prime}$ contains $p^{\prime}(=2)$ and $S$ contains $p^{*}(=3)$.
(0) From now on, $S^{\prime}$ will "copy" $S$.

## Proof.

## Proof.

(7) If $S$ evicted the page $p^{*}, S^{\prime}$ will evict the page $p^{\prime}$. Then, the cache status of $S$ and that of $S^{\prime}$ will be the same. $S$ and $S^{\prime}$ will be exactly the same from now on.

## Proof.

(7) If $S$ evicted the page $p^{*}, S^{\prime}$ will evict the page $p^{\prime}$. Then, the cache status of $S$ and that of $S^{\prime}$ will be the same. $S$ and $S^{\prime}$ will be exactly the same from now on.
(8) Assume $S$ did not evict $p^{*}(=3)$ before we see $p^{\prime}(=2)$.

## Proof.

(7) If $S$ evicted the page $p^{*}, S^{\prime}$ will evict the page $p^{\prime}$. Then, the cache status of $S$ and that of $S^{\prime}$ will be the same. $S$ and $S^{\prime}$ will be exactly the same from now on.
(8) Assume $S$ did not evict $p^{*}(=3)$ before we see $p^{\prime}(=2)$.

## Proof.

## Proof.

## Proof.

## Proof.

(9) If $S$ evicts $p^{*}(=3)$ for $p^{\prime}(=2)$, then $S$ won't be optimum. Assume otherwise.

## Proof.

(2) If $S$ evicts $p^{*}(=3)$ for $p^{\prime}(=2)$, then $S$ won't be optimum. Assume otherwise.

## Proof.

(2) If $S$ evicts $p^{*}(=3)$ for $p^{\prime}(=2)$, then $S$ won't be optimum. Assume otherwise.

$$
\begin{aligned}
& 4 ., 5,4 .
\end{aligned}
$$

## Proof.

(2) If $S$ evicts $p^{*}(=3)$ for $p^{\prime}(=2)$, then $S$ won't be optimum. Assume otherwise.

## Proof.

(9) If $S$ evicts $p^{*}(=3)$ for $p^{\prime}(=2)$, then $S$ won't be optimum. Assume otherwise.
(10) So far, $S^{\prime}$ has 1 less page-miss than $S$ does.

## Proof.

(2) If $S$ evicts $p^{*}(=3)$ for $p^{\prime}(=2)$, then $S$ won't be optimum. Assume otherwise.
(10) So far, $S^{\prime}$ has 1 less page-miss than $S$ does.
(1) The status of $S^{\prime}$ and that of $S$ only differ by 1 page.

## Proof.

## Proof.

(12) We can then guarantee that $S^{\prime}$ make at most the same number of page-misses as $S$ does.

## Proof.

(3) We can then guarantee that $S^{\prime}$ make at most the same number of page-misses as $S$ does.

- Idea: if $S$ has a page-hit and $S^{\prime}$ has a page-miss, we use the opportunity to make the status of $S^{\prime}$ the same as that of $S$.
