

Output  $\circ$   $E' \subseteq E$  s.t.  $T$  is a subgraph

(i)  $T = (V, E')$  is connected

(ii)  $C(T) = \sum_{e \in T} c_e$  is minimized.

---

Man 29

PROP  $\circ$  let  $c_e > 0 \forall e \in E$ , then any optimal solution  $T = (V, E')$  is a tree.

Pf. (idea): By contradiction.

Assume  $T = (V, E')$  is an optimal solution, but  $T$  is not a tree.  $\rightarrow (*)$

Since  $T$  is connected  $\Rightarrow \exists$  a cycle in  $T$ .

Let  $e$  be any edge in  $c$ .

Delete  $e$  from  $T$ .

~~$C(T)$~~   $T' = (V, E' \setminus \{e\})$

Claim 1  $\circ$   $C(T') < C(T)$ ,  $C(T') = C(T) - c_e < C(T)$

Claim 2  $\circ$   $T'$  is still connected.  $\uparrow$  as  $c_e > 0$

Case 1:  $\exists$  an  $x$ - $y$  path that doesn't use  $e = (u, w)$ .  $\hookrightarrow$

Case 2: All  $x-y$  paths that use  $e=(u,w)$   
 $\Rightarrow$  Use the rest of  $C$  to connect  
 $u$  &  $w$ .

$\Rightarrow$   $x, y$  are still connected.

Claim 1 + Claim 2  $\Rightarrow$   $T'$  is a better solution  
than  $T$ .  $\Rightarrow$  Contradict  $T$  is optimal.  
(\*) □

### Cut Property Lemma

Assume all  $e_i$ 's are distinct.

For all cuts  $(S, V \setminus S)$ ,  $S \neq \emptyset$ ,  $V \setminus S \neq \emptyset$   
 $\hookrightarrow S \neq V$

Consider all "crossing" edges.

Let  $e$  be the cheapest crossing edge.

$\Rightarrow$   $e$  is in ALL MSTs.
