CSE 331

# Connectivity Problem

*Input:* Graph  $G = (V, E)$  and  $s$  in  $V$

*Output:* All  $t$  connected to  $s$  in  $G$

# Algorithm motivation

# Breadth First Search (BFS)

## BFS via examples

In which we derive the breadth first search (BFS) algorithm via a sequence of examples.

### Expected background

These notes assume that you are familiar with the following:

- Graphs and their representation. In particular,
  - Notion of connectivity of nodes and connected components of graphs
  - Adjacency list representation of graphs
  - Notation:
    - $G = (V, E)$
    - $n = |V|$  and  $m = |E|$
    - $CC(s)$  denotes the connected component of  $s$
- Trees and their basic properties

### The problem

In these notes we will solve the following problem:

# Breadth First Search (BFS)

Build layers of vertices connected to  $s$

$$L_0 = \{s\}$$

Assume  $L_0, \dots, L_j$  have been constructed

$L_{j+1}$  set of vertices not chosen yet but are connected to  $L_j$

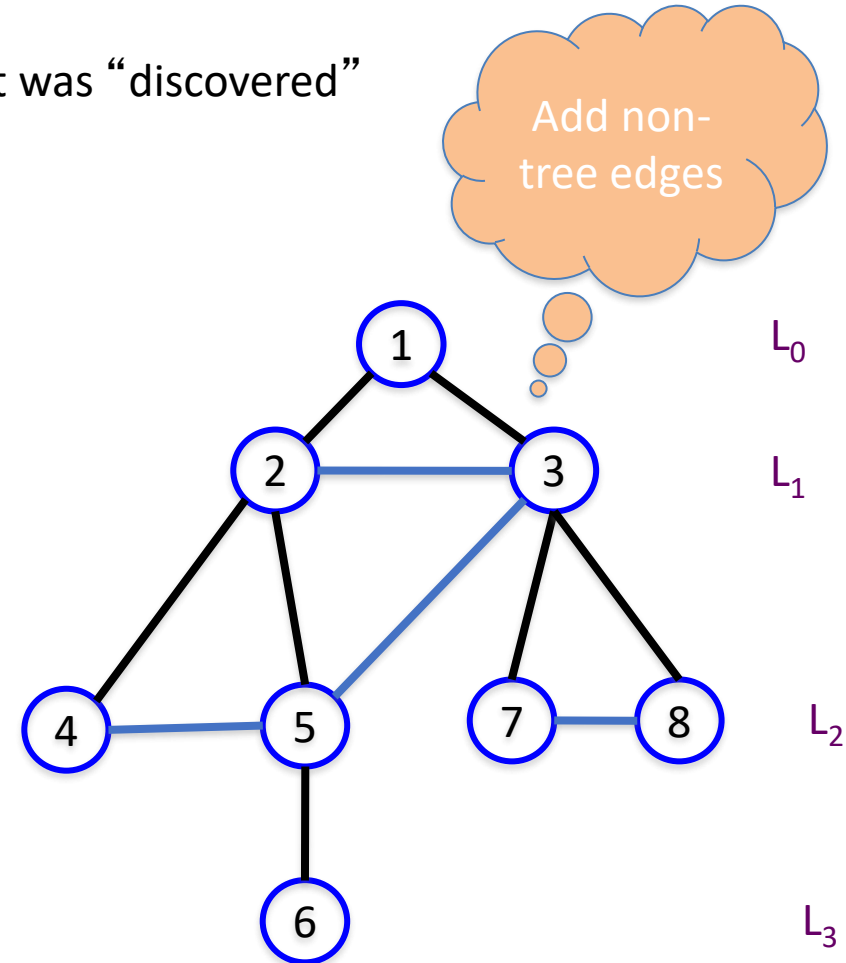

Stop when new layer is empty

# BFS Tree

BFS naturally defines a tree rooted at  $s$

$L_j$  forms the  $j$ th “level” in the tree

$u$  in  $L_{j+1}$  is child of  $v$  in  $L_j$  from which it was “discovered”

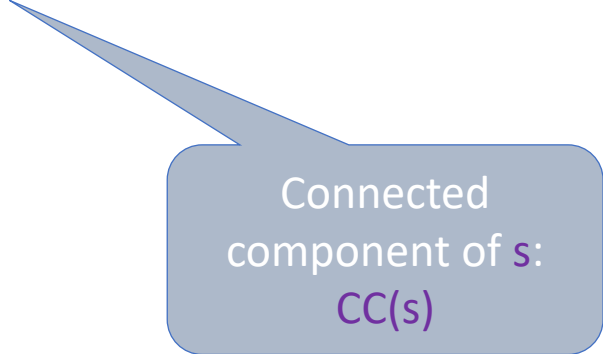

Argue on the board...

# Connectivity Problem

*Input:* Graph  $G = (V, E)$  and  $s$  in  $V$

*Output:* All  $t$  connected to  $s$  in  $G$

Connected  
component of  $s$ :  
 $CC(s)$

# Connected Components

Set of all vertices connected to vertex  $s$  is called its connected component  $cc(s)$ .

$$cc(2) = \{1, 2, 3, 6\}$$

$$cc(5) = \{4, 5\}$$

# Two facts about BFS trees

All non-tree edges are in the same or consecutive layer

If  $u$  is in  $L_i$  then  $\text{dist}(s,u) = i$

# Computing Connected Component

Explore( $s$ )

Start with  $R = \{s\}$

While exists  $(u,w)$  edge  $w$  not in  $R$  and  $u$  in  $R$

    Add  $w$  to  $R$

Output  $R^* = R$

Argue correctness on the board...
