

The Cognitive Bases of Music Performance

Peter Q. Pfordresher

*Department of Psychology
Auditory Perception and Action Lab*

Overview

- Memory and planning
- Timing in performance
- Feedback in performance
- Musical deficits: The case of “bad” singing

Memory and Planning

- Errors and “what’s on your mind?”
 - Freud’s best contribution!
 - Lashley (1951): Errors suggest hierarchical, not serial, organization

Chaining

Hierarchy

Memory and planning

- Serial ordering errors
 - Target vs. intruder
- Target/intruder relationships
 - Distance
 - Direction
 - Anticipation
 - Perseveration
 - Exchange

Examples

“But barkling water is bad for you”
(intended: sparkling)
Vousden et al., 2000

Memory and Planning

- Errors constrained by structure
 - Remain within a melodic line (Plamer & van De Sande, 1993; Palmer, 1996)
 - Stay within a musical phrase (P&vDs, 1995)
- Directional characteristics of planning
 - Anticipations = thinking ahead
 - More anticipations = fewer errors (e.g., Drake & Palmer, 2000; Dell et al., 1997)
 - Faster tempo = fewer anticipations (Drake & Palmer, 2000; but not Palmer & Pfordresher, 2003)

Planning and structure

Errors move toward boundaries
(but do not cross...)

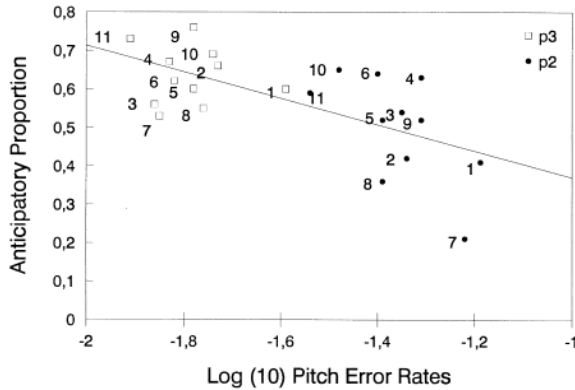

Palmer & van de Sande, 1995

Anticipations are GOOD

(Drake & Palmer, 2000)

In speech
(Dell, Burger, & Svec, 1997)

Memory and Planning

- Planning and distance
 - Greater distance for adults
 - Greater distance for slower tempi
- The range model (Palmer & Pfordresher, 2003; Pfordresher et al., 2006). Distance results from

- Serial proximity $S_x = a^{(|x|/p)}$.

- Metrical similarity $M_x(i) = \text{sim}(m_i, m_{i+x}) = 1 - \frac{|m_i - m_{i+x}|}{m_i + m_{i+x}} = 1 - \frac{\Delta m}{2\bar{m}}$.

(Serial proximity)

(Metrical similarity)

The range model

The diagram illustrates the range model. At the top, a bar chart labeled 'Event Activation' shows the amplitude of events over time. Below it, a musical staff shows a sequence of notes. Underneath the staff is a 'Metrical Grid' with two levels: Level 2 and Level 1. Level 2 has 'x' marks at every second beat, and Level 1 has 'x' marks at every beat. A dashed box highlights the 'Current (planned) event' at a specific point in time. To the left, a small illustration shows a person playing a piano.

Serial = "tapering off" from current
Metrical = "up/down" pattern

$$Y_{x,i} = S_x * M_{x,i} = \left[a^{(x/i)} \right] * \left[1 - \frac{m_i - m_{i+x}}{m_i + m_{i+x}} \right]$$

Timing

- Maintaining regularity: Two sources of variability (Wing & Kristofferson, 1973):
- Expressive timing
 - Present even in "deadpan" performances (Palmer, 1989)
 - Associated with structure (Todd, 1985)
 - Association with movement? (Sundberg & Verillo, 1999)
- Relational invariance? (e.g., Repp, 1998)
Problems:
 - Ornaments (Desain & Honig, 1994)
 - "Swing ratios"

The Wing & Kristofferson model

KEY C_j Interval between timekeeper trigger pulses
 D_j Response delay
 I_j Interresponse interval

“Clock” variability

“Metronomic” performance?

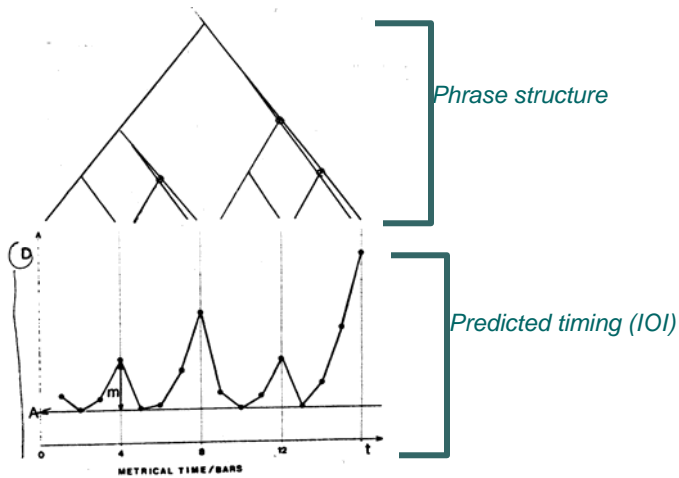

Palmer, 1989

Music and Structure

(Todd, 1985)

Music and Motion

(Friberg & Sundberg, 1999)

$$v(x) = [1 + (v_{end}^q - 1)x]^{1/q}$$

Relational invariance and generalized motor programs

Rhythm at fast tempo (IOIs):

|---500---|---250---|---250---|

Rhythm at slower tempo (IOIs):

|-----800-----|---400---|---400---|

Predicting IOIs is easy:

$$IOI_i = \beta * x_i$$

Where β = tempo (base IOI)
and x_i is the ratio for each IOI

$\beta * [1 \ .5 \ .5]$, where $\beta = 500$ or 800

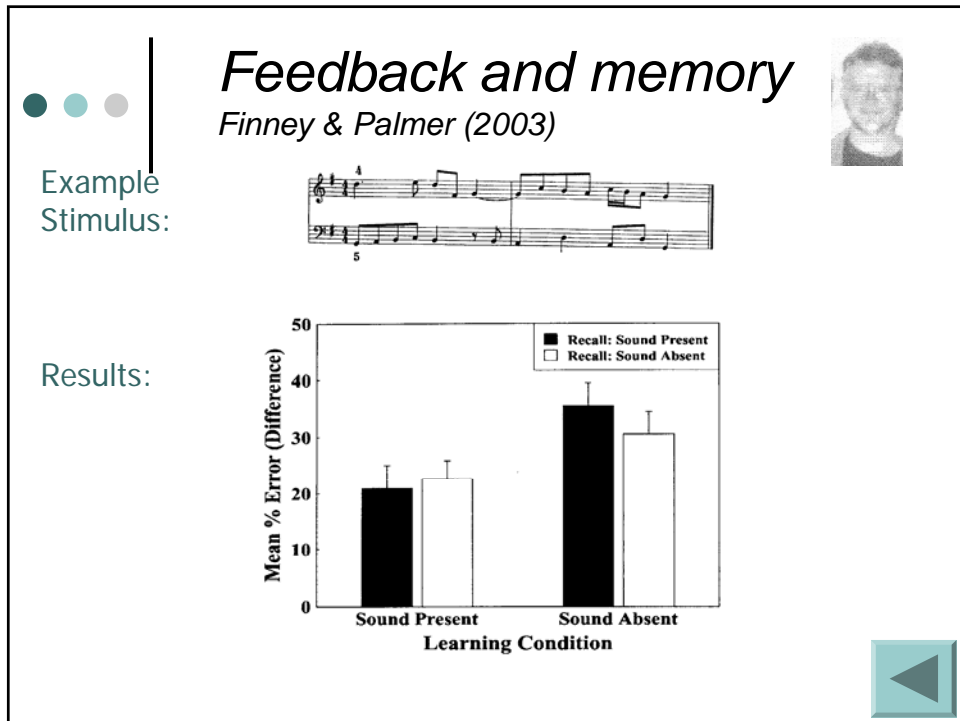

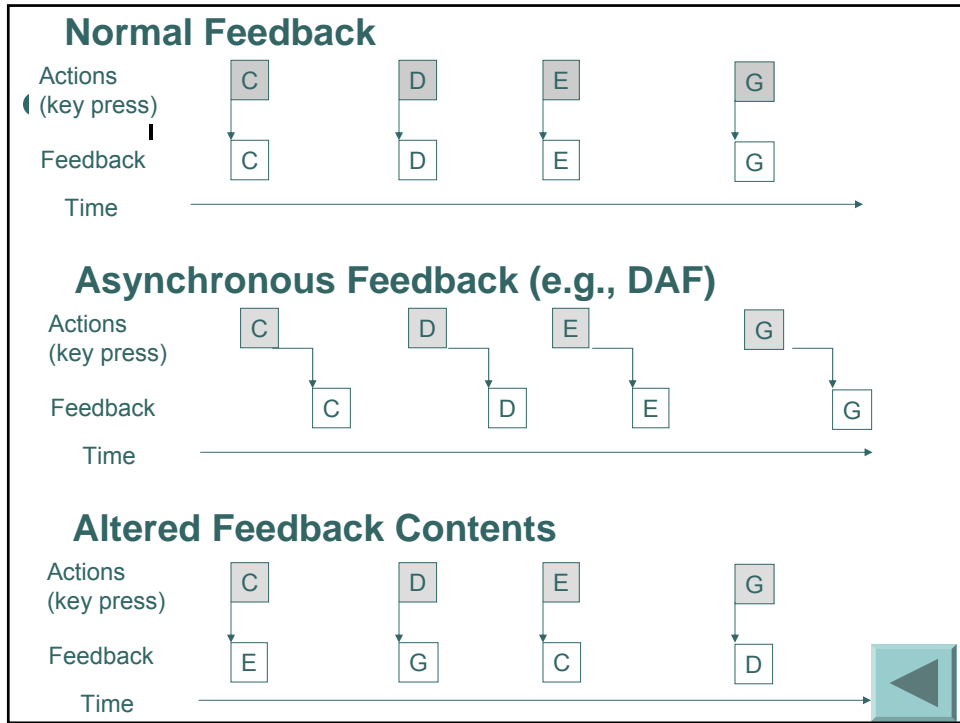

Tempo like a “switch” that turns up or down the IOIs

Perceptual feedback

- Focus mostly on *auditory*
 - Altered auditory feedback
- What is necessary?
 - Presence of feedback?
 - Facilitates memory, but not necessary
 - Absence doesn't disrupt piano (Repp, 1999)
 - Though more important for singing
 - Timing of feedback? IMPORTANT
 - Disruption varies with delay amount
 - Probably function of rhythm

Disruption from feedback absence?

Piano: Repp, 1999

Voice: Mürbe et al., 2003

Delayed auditory feedback

Absolute time:
Gates et al. (1974)

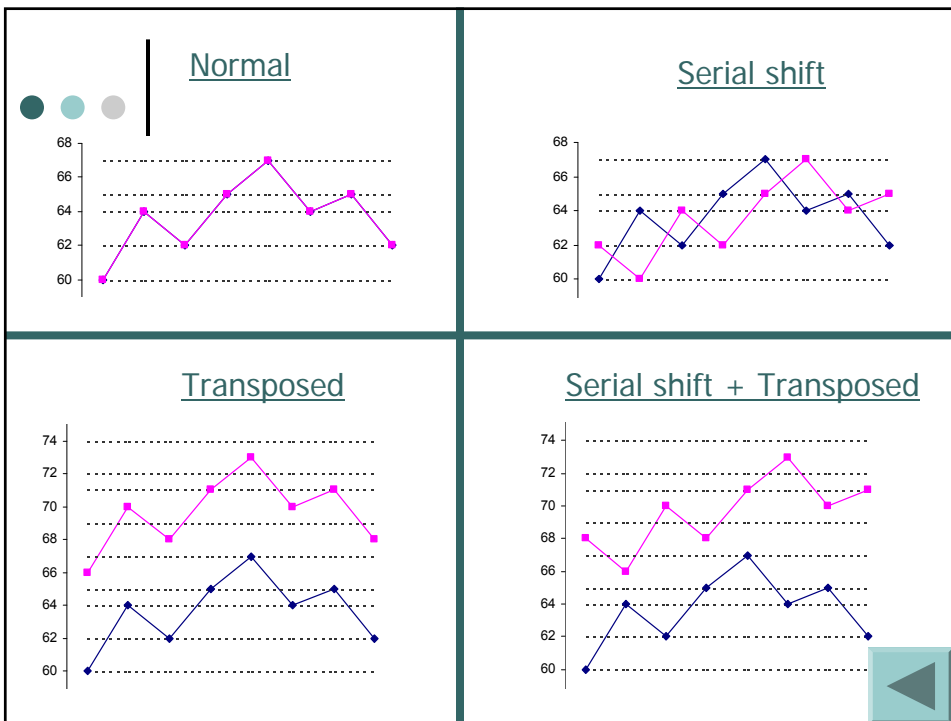

Relative time:
Pfordresher & Benitez
(2007)

Perceptual feedback

- Feedback contents? More complex
 - Random pitch sequences: no disruption (Finney, 1997)
 - *Serial shifts* do disrupt (Pfordresher, 2005)
 - Even when shift is a “variation” (Pfordresher, in press)
- What is the role of feedback?
 - NOT “feedback”!!!
 - Rather, perception and action share a common “plan” (Pfordresher, 2006)

● ● ● | *A framework for auditory feedback* (Pfordresher, 2006)

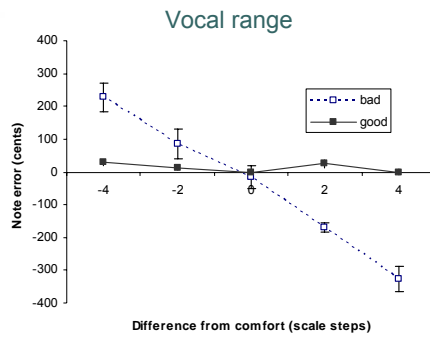

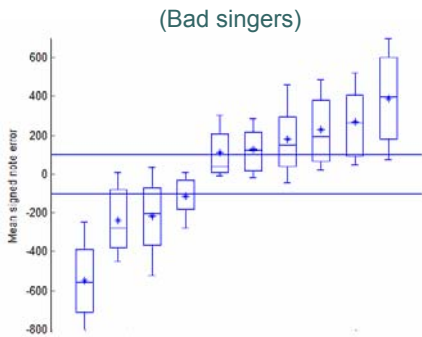

● ● ● | Musical deficits: "Bad" singing

- Nature of the deficit
 - Mistuned notes
 - May be influenced by vocal range
 - Compress pitch intervals
 - NOT: contour errors
 - Sing faster than they should (Dalla Bella et al., 2007)

Bad singing and mistuning

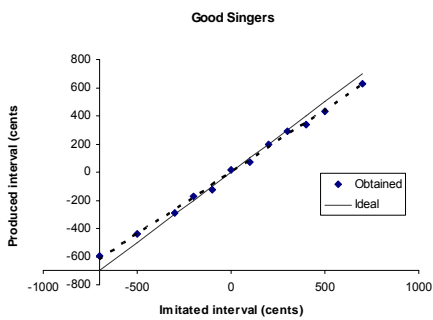

Pfordresher & Brown (2007)
See also Welch (1979)

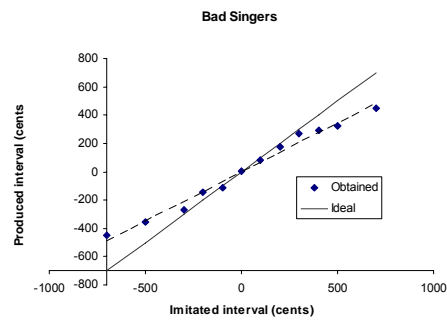

Bad singing and pitch intervals

Pfordresher & Brown (2007)

Slope = .88

Slope = .69

NOTE: Both are good fits

“Bad” singing

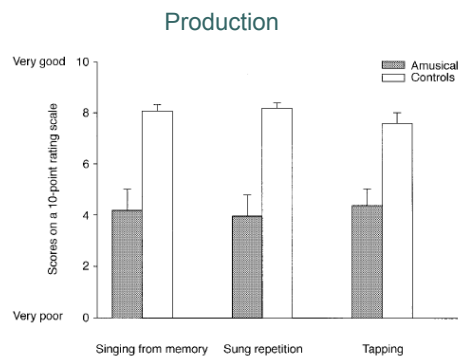

- What causes bad singing? Still a question...
 - Tone deafness (literally)?
 - Congenital Amusia (Peretz et al., 2002)
 - BUT: evidence that bad singers are good listeners (Bradshaw & McHenry, 200; Dalla Bella et al., 2007; Pfordresher & Brown, 2007)
 - Motor control? Not likely either...
- How prevalent is bad singing?
 - Probably ~10% of population
 - Twice as prevalent as true “tone deafness”

Congenital amusia and singing

Hyde & Peretz, 2004

Ayotte, Peretz, & Hyde, 2004
