# Paradigms for Designing Algorithms

## Greedy algorithm

- Make a greedy choice
- Prove that the greedy choice is safe
- Reduce the problem to a sub-problem and solve it iteratively
- Usually for optimization problems

## Divide-and-conquer

- Break a problem into many **independent** sub-problems
- Solve each sub-problem separately
- Combine solutions for sub-problems to form a solution for the original one
- Usually used to design more efficient algorithms

# Paradigms for Designing Algorithms

## Dynamic Programming

- Break up a problem into many **overlapping** sub-problems
- Build solutions for larger and larger sub-problems
- Use a **table** to store solutions for sub-problems for reuse

## Recall: Computing the $n$ -th Fibonacci Number

- $F_0 = 0, F_1 = 1$
- $F_n = F_{n-1} + F_{n-2}, \forall n \geq 2$
- Fibonacci sequence: 0, 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89,  $\dots$

### Fib( $n$ )

```
1:  $F[0] \leftarrow 0$ 
2:  $F[1] \leftarrow 1$ 
3: for  $i \leftarrow 2$  to  $n$  do
4:    $F[i] \leftarrow F[i - 1] + F[i - 2]$ 
5: return  $F[n]$ 
```

## Recall: Computing the $n$ -th Fibonacci Number

- $F_0 = 0, F_1 = 1$
- $F_n = F_{n-1} + F_{n-2}, \forall n \geq 2$
- Fibonacci sequence: 0, 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89,  $\dots$

2:  $F[1] \leftarrow 1$ 
3: for  $i \leftarrow 2$  to  $n$  do
4:    $F[i] \leftarrow F[i - 1] + F[i - 2]$ 
5: return  $F[n]$ 
```

- Store each  $F[i]$  for future use.

## Subset Sum Problem

**Input:** an integer bound  $W > 0$

a set of  $n$  items, each with an integer weight  $w_i > 0$

**Output:** a subset  $S$  of items that

$$\text{maximizes } \sum_{i \in S} w_i \quad \text{s.t. } \sum_{i \in S} w_i \leq W.$$

## Subset Sum Problem

**Input:** an integer bound  $W > 0$

a set of  $n$  items, each with an integer weight  $w_i > 0$

**Output:** a subset  $S$  of items that

$$\text{maximizes } \sum_{i \in S} w_i \quad \text{s.t. } \sum_{i \in S} w_i \leq W.$$

- Motivation: you have budget  $W$ , and want to buy a subset of items, so as to spend as much money as possible.

# Matrix Chain Multiplication

## Matrix Chain Multiplication

**Input:**  $n$  matrices  $A_1, A_2, \dots, A_n$  of sizes  $r_1 \times c_1, r_2 \times c_2, \dots, r_n \times c_n$ , such that  $c_i = r_{i+1}$  for every  $i = 1, 2, \dots, n - 1$ .

**Output:** the order of computing  $A_1 A_2 \dots A_n$  with the minimum number of multiplications

**Fact** Multiplying two matrices of size  $r \times k$  and  $k \times c$  takes  $r \times k \times c$  multiplications.

## Example:

- $A_1 : 10 \times 100$ ,  $A_2 : 100 \times 5$ ,  $A_3 : 5 \times 50$

$$\text{cost} = 5000 + 2500 = 7500$$

$$\text{cost} = 25000 + 50000 = 75000$$

- $(A_1 A_2) A_3 : 10 \times 100 \times 5 + 10 \times 5 \times 50 = 7500$
- $A_1 (A_2 A_3) : 100 \times 5 \times 50 + 10 \times 100 \times 50 = 75000$

## Example:

- $A_1 : 10 \times 100$ ,  $A_2 : 100 \times 5$ ,  $A_3 : 5 \times 50$

$$\text{cost} = 5000 + 2500 = 7500$$

$$\text{cost} = 25000 + 50000 = 75000$$

- $(A_1 A_2) A_3 : 10 \times 100 \times 5 + 10 \times 5 \times 50 = 7500$
- $A_1 (A_2 A_3) : 100 \times 5 \times 50 + 10 \times 100 \times 50 = 75000$

## Dynamic Programming

- Break up a problem into many **overlapping** sub-problems
- Build solutions for larger and larger sub-problems
- Use a **table** to store solutions for sub-problems for reuse

## Comparison with greedy algorithms

- Greedy algorithm: each step is making a small progress towards constructing the solution
- Dynamic programming: the whole solution is constructed in the last step

## Comparison with divide and conquer

- Divide and conquer: an instance is broken into many **independent** sub-instances, which are solved separately.
- Dynamic programming: the sub-instances we constructed are overlapping.
